## CERTIFICATE

This is to certify that the work presented in the thesis entitled "ASYMMETRIC DIHYDROXYLATION APPROACH TO THE ENANTIOSELECTIVE SYNTHESES OF BIOACTIVE MOLECULES AND PCC MEDIATED OXIDATIVE ORGANIC TRANSFORMATION" submitted by Rodney A. Fernandes was carried out by the candidate at the National Chemical Laboratory, Pune, under my supervision. Such materials as obtained from other sources have been duly acknowledged in the thesis.

## CANDIDATE'S DECLARATION

#### Abstract

I hereby declare that the thesis entitled "ASYMMETRIC DIHYDROXYLATION APPROACH TO THE ENANTIOSELECTIVE SYNTHESES OF BIOACTIVE MOLECULES AND PCC MEDIATED OXIDATIVE ORGANIC TRANSFORMATION" submitted for the degree of Doctor of Philosophy in Chemistry to the University of Pune has not been submitted by me to any other University or Institution. This work was carried out at the National Chemical Laboratory, Pune, India.

Rodney A. Fernandes
Senior Research Fellow (CSIR)
Division of Organic Chemistry: Technology

## ACKNOWLEDGEMENTS

It gives me great pleasure to place on record my deep sense of gratitude to my research supervisor, Dr. Pradeep Kumar for his encouragement and scientific temperament, which furthered my interest in synthetic organic chemistry. He has given me liberty to express my own views and ideas. He has taught me to be concise, systematic and correct in my approach from the formulation of ideas to the presentation of the results.

I take this opportunity to thank Prof. S. K. Paknikar, Dr. J. K. Kirtany and Dr. S. P. Kamat from Goa University, Goa for preliminary preparation to take up research work.

My sincere thanks goes to Dr. T. Ravindranathan (Former Head, OCT Division) and Dr. M. K. Gurjar, Head, OCT Division for support and encouragement. I extend my gratitude to Dr. V. H. Deshpande, Dr. U. R. Kalkote, Dr. K. V. Srinivasan, Dr. Ganesh Pandey and Dr. Borate for their help during the course of this work.

The kind help extended by the NMR facility fraternity Mr. Samuel, Dr. Rajmohan, Mr. Sathe and Miss Rupali, Mass Analysis by Mrs. Shantakumari and help by Analytical, Glass blowing and Library staff is greatly acknowledged.

This page would be incomplete without the mention of my lab mates who extended help throughout the tenure of my work in NCL. Thanks to Mandar, Subbarao, Priti, Ramalingam, Anis, Vasu, Puspesh and Pandey. I am also grateful to my colleagues and friends: Sushil Jha, Dr. Moneesha, Dr. C. Ramesh, Dr. Gorpade, Sambhaji, Ilyas, Yogesh, Vijay, Kale, Kapoor, Tiwari, Sanjay, Bidhan, Shivappa, Dr. Kharul, Dr. Bulbule, Joseph, Siddarth Rai, Sanki, Bennur, Dr. Sureshan, Dr. Pallan, Nagendra, Pallavi, Rajgopal, Dr. Gajare, Dr. Nabendu, Sadafulle, Anil, Agnel Fernandes and many more.

Support from OCT office staff: Babush, Catherine, Kulkarni, Vadrarajan, Rannowde and Ballan is also acknowledged.

I am equally indebted to the Director NCL for giving infrastructure facilities to work in a renowned institution like NCL. CSIR New Delhi is acknowledged for valuable support in the form of Junior and Senior Research Fellowships.

Finally I would like to thank in a special way my Parents, Brother, Sisters and Brothers-in-law who extended support, encouragement, love and appreciation throughout my research work to excel in whatever I did. Rodney
A.

Fernandes

## GUOTED

It gives me immense pleasure to compile my research work of the last few years, working in the Division of Organic Chemistry: Technology, National Chemical Laboratory, Pune, India in this thesis. I had the unique experience of the difference in framing schemes on paper and practically executing them. Research, I feel is a combination of lot of patience, a proper understanding of work, systematic execution of ideas, imagination and proper diagnosis of failures to hunt for a reasonable solution. I am obliged for the encouragement and appreciation from my research mentor, Dr. Pradeep Kumar who introduced me to one of the fascinating areas of the last decade, the "Sharpless Asymmetric Dihydroxylation". I remember here when I said in one of the group meetings- it is a fascinating reaction involving several reagents working collectively', my research mentor quoted 'it is a fascinating reaction being carried
out in water".
Asymmetric Epoxidation
Dihydroxylation

Prof. K. B. Sharpless

I wish to quote a few words on Prof. K. Barry Sharpless, Scripps Research Institute, of whom I am very much fond about. His pioneering work on "Chirally catalyzed oxidations" bagged him the Nobel Prize in part in Chemistry for the year 2001. The renowned reactions-'Sharpless Asymmetric Epoxidation' and 'Sharpless Asymmetric Dihydroxylation' (SAD) have opened the gateway to several complex matural product syntheses. I had an opportunity to employ the SAD reaction towards the asymmetric syntheses of a few bioactive molecules and compile it in this thesis for the award of the degree of Doctor of Philosophy in Chemistry.

While Mother Nature, an architect par excellence has her own ways of synthesizing several bioactive compounds, the synthetic organic chemist will always be bold to explore the hidden mysteries and work in parallel with Mother Nature.

## ABSTRACT

The Thesis entitled "Asymmetric Dihydroxylation Approach to the Enantioselective Syntheses of Bioactive Molecules and PCC Mediated Oxidative Organic Transformation" is divided into five chapters.
Chapter 1: describes a brief introduction to the Sharpless asymmetric dihydroxylation (SAD) and cyclic sulfites/sulfates as synthetic intermediates.

Chapter 2: deals with the enantioselective synthesis of $\beta$-hydroxy- $\delta$-lactones and is divided into two sections.

Chapter 3: constitutes the asymmetric synthesis of vicinal amino alcohols and is divided into two sections.

Chapter 4: includes the enantioselective synthesis of chiral epoxides via asymmetric dihydroxylation and is divided into two sections.

Chapter 5: examines a new PCC-mediated unusual C-C bond cleavage reaction during oxidation of homobenzylic alcohols.

## Chapter 1: Asymmetric Dihydroxylation and Cyclic Sulfites/Sulfates as Synthetic Intermediates.

This chapter gives a brief introduction to Sharpless asymmetric dihydroxylation (SAD) reaction and cyclic sulfites/sulfates as synthetic intermediates. Catalytic asymmetric reactions provide an especially practical entry into the chiral world due to their economical use of asymmetric inducing agents. Especially useful is the carbon-heteroatom bond forming reactions, since the resulting functionality can be readily manipulated to produce many important classes of compounds. The SAD reaction is one such reaction developed in early 1990. ${ }^{1}$ It has evolved as one of the most powerful methods for enantioselective oxidation of olefins to optically active vicinal diols that are versatile and convenient building blocks in the synthesis of bioactive compounds.

In this chapter, the development of SAD reaction from stoichiometric to catalytic version, the mechanism, reaction conditions and varied ligands used along with recent applications will be covered. In our synthetic endeavors we have employed the chiral diol compounds obtained by SAD reaction towards the synthesis of $\beta$-hydroxy- $\delta$-lactones,
vicinal amino alcohols and chiral epoxides. To bring about the functional group changes we have also employed the chemistry of cyclic sulfites/sulfates as intermediates. ${ }^{2}$ This chapter will also cover the synthesis, reactivity and applications of cyclic sulfites/sulfates as synthetic intermediates.

## Chapter 2: Enantioselective Synthesis of $\beta$-Hydroxy- $\delta$-Lactones

This chapter deals with the asymmetric synthesis of $\beta$-hydroxy- $\delta$-lactones and is divided into two sections.

## Section A: Enantioselective Synthesis of (R)-Mevalonolactone

Mevalonolactone 1 or its open form, mevalonic acid 2 is the biosynthetic precursor of most terpenoids, steroids, carotenoids, isoprenoids and pentanoids. ${ }^{3}$ Mevalonolactone was first discovered and synthesized by resolution method by Folkers and coworkers. ${ }^{4}$ We have employed a five-step strategy for the synthesis of $(R)$-mevalonolactone (Scheme 1).

Scheme 1
The hydroxyl protection of $\mathbf{3}$ and Sharpless asymmetric dihydroxylation to diol $\mathbf{4}$, followed by regioselective nucleophilic opening of cyclic sulfate intermediate 5 with cyanide nucleophile to give $\mathbf{6}$ are the key steps in the synthesis. Basic hydrolysis of $\mathbf{6}$ followed by acidic hydrolysis resulted in deprotection of ethoxy ethyl ether and concomitant cyclization to give $(R)$-mevalonolactone 1 . The compound 6 was also synthesized from tosyl compound 7 by nucleophilic displacement with cyanide.

Thus, a short and efficient practical synthesis of $(R)$-mevalonolactone is achieved.

## Section B: Enantioselective Synthesis of the Lactone Moiety of HMG-CoA Reductase Inhibitors-Compactin and Mevinolin

Cholesterol biosynthesis inhibition has become a powerful tool to lower plasma cholesterol high levels. 3-Hydroxy-3-methyl-glutaryl coenzyme reductase (HMGR) is a target of choice, because it is the early rate-limiting step in the biosynthesis of cholesterol.

Mevinolin and compactin 8 are specific inhibitors of HMGR and are effective in lowering blood plasma cholesterol levels. ${ }^{5}$

9

The key structural feature in HMGR inhibitors is the $\beta$-hydroxy- $\delta$-lactone moiety 9 that is connected to a functionalized decalin unit via an ethylene bridge. In this section the asymmetric synthesis of the $\beta$-hydroxy- $\delta$-lactone moiety $\mathbf{9}^{6}$ is described. (S)-Malic acid $\mathbf{1 0}$ serves to establish the stereochemistry at C-6, while the C-4 hydroxyl is arrived at through the regioselective hydride opening of cyclic sulfite 13. The synthetic route is depicted in Scheme 2.

Scheme 2
Thus, a short and efficient asymmetric synthesis of the $\beta$-hydroxy- $\delta$-lactone moiety of mevinic acids-compactin and mevinolin, with requisite stereochemistry at C-4 and C-6 has been achieved.

## Chapter 3: Asymmetric Synthesis of Vicinal Amino Alcohols: Dihydrosphingosine and Phytosphingosines

The vicinal amino alcohol moiety is the key structural feature in a variety of bioactive molecules. ${ }^{7}$ This chapter summarizes our studies on the asymmetric synthesis of dihydrosphingosine and phytosphingosines and is divided into two sections.

## Section A: Enantioselective Synthesis of D-(+)-erythro-Dihydrosphingosine

Sphingosine 14 and its biosynthetic precursor dihydrosphingosine (sphinganine, 15) are long chain amino alcohols forming the backbone structures for complex molecules called sphingolipids. Dihydrosphingosine and related long chain bases display potent inhibiting properties of protein kinase C both in vivo and in vitro and thus play a pivotal role in cell recognition, cell growth modulation and signal transmission. ${ }^{8}$

We have employed the asymmetric dihydroxylation process to convert prochiral olefin to chiral diol and regioselective opening of cyclic sulfite derived there from, towards the asymmetric synthesis of D-(+)-erythro-dihydrosphingosine 15 (Scheme 3).

Scheme 3

Asymmetric dihydroxylation of olefin 17 gave diol 18. Diol 18 was converted into cyclic sulfite 19, which was opened regioselectively with azide nucleophile to give 20. Dual reduction of ester and azide functionality in $\mathbf{2 0}$ with $\mathrm{LiAlH}_{4}$ gave D -(+)-erythrodihydrosphingosine 15, which was isolated by converting into triacetate derivative 21.

Alternatively, the C-2 chirality of $\mathbf{1 5}$ was arrived by selective 1,3-benzylidene formation as shown in Scheme 4. Asymmetric dihydroxylation of allylic alcohol 22 gave triol 23. Selective protection of 1,3-hydroxyls as cyclic benzylidene, followed by conversion of C-2 hydroxyl into the azido functionality gave 25. Subsequent deprotection of benzylidene, reduction and acetylation gave the triacetate derivative 21.

Scheme 4

Thus, a short and practical asymmetric synthesis of dihydrosphingosine has been achieved through asymmetric dihydroxylation either by employing a cyclic sulfite intermediate or a cyclic benzylidene intermediate.

## Section B: Double Diastereoselection in Asymmetric Dihydroxylation: Application to the Diastereoselective Synthesis of $\mathrm{C}_{18}$-Phytosphingosines.

Phytosphingosine 26 exists abundantly as one of the molecular species of sphingolipids in microorganisms, plants and many mammalian tissues. In addition to its structural function as the long-chain base of sphingolipids in membranes, phytosphingosine itself is a bioactive lipid, a potential heat stress signal in yeast cells. Of the eight $\mathrm{C}_{18}$-phytosphingosine isomers (ribo-, arabino-, xylo- and lyxo-series) most synthetic studies have been focused primarily on the preparation of ribo- or arabino-phytosphingosines. No report on the asymmetric synthesis of L-xylo-[2R,3S,4S]-C $\mathrm{C}_{18}$-phytosphingosine 27 was known until we arrived at its first synthesis.

26

27

28

Like many other reactions including the Sharpless asymmetric epoxidation and the Sharpless asymmetric dihydroxylation of olefins, the pre-existing chiral information in the substrate has a marked influence on the stereoselective outcome of the reaction. With a view to exploit the concept of double diastereoselection, we prepared the enantiomerically enriched terminal olefin 33 (and its enantiomer 34) as shown in Scheme 5.

Scheme 5
Asymmetric dihydroxylation of olefin 30, dihydroxyl protection, ester reduction followed by oxidation of alcohol 32 to aldehyde and subsequent Wittig olefination provided the terminal olefin 33. Similarly $\mathbf{3 4}$ was prepared by $\beta$-dihydroxylation of olefin $\mathbf{3 0}$ and following the same reaction steps as described for 33 .

The olefins $\mathbf{3 3}$ and $\mathbf{3 4}$ have been subjected to asymmetric dihydroxylation by employing different ligands. The influence of existing chirality and ligand induction in matched and mismatched cases have been studied (Table 1).

Ligand, $\mathrm{K}_{3} \mathrm{Fe}\left(\mathrm{CN}_{6}, \mathrm{~K}_{2} \mathrm{CO}_{3}\right.$, $\mathrm{OsO}_{4}, t \mathrm{BuOH}-\mathrm{H}_{2} \mathrm{O}$ [1:1],
$0^{\circ} \mathrm{C}, 24 \mathrm{~h}$

Table 1: Double diastereoselection in AD of olefins 33 and 34.

| Substrate | Ligand | 35 | 36 | 37 | 38 | Yield \% | Diastereomeric mixture |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 33 | $(\mathrm{DHQ})_{2} \mathrm{PHAL}$ | 1 | 2 | - | - | 89 | $39[\alpha]_{\mathrm{D}}{ }^{20}-17.3\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$ |
| 33 | $(\mathrm{DHQD})_{2} \mathrm{PHAL}$ | 5 | 1 | - | - | 92 | $40[\alpha]_{\mathrm{D}}{ }^{20}-19.5\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$ |
| 33 | $(\mathrm{DHQD})_{2} \mathrm{AQN}$ | 6 | 1 | - | - | 69 | Pure diastereomer $35[\alpha]_{D}^{20}-20.1\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$ |
| 34 | $(\mathrm{DHQ})_{2} \mathrm{PHAL}$ | - | - | 5.45 | 1 | 93 | $41[\alpha]_{\mathrm{D}}{ }^{20}+20.3\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$ |
| 34 | $(\mathrm{DHQD})_{2} \mathrm{PHAL}$ | - | - | 1 | 2 | 92 | $42[\alpha]_{\mathrm{D}}{ }^{20}+18.2\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$ |
| 34 | Pyridine | - | - | 4.3 | 1 | 83 | $43[\alpha]_{\mathrm{D}}{ }^{20}+18.7\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$ |

The diastereomeric mixture containing 35 and 36 (6:1) was separated by flash column chromatography and pure diastereomer 35 was employed in the total synthesis of L-xylo[ $2 R, 3 S, 4 S]$ - $\mathrm{C}_{18}$-phytosphingosine 27 as shown in Scheme 6 as the tetraacetate 47.

Scheme 6
Selective mono-hydroxyl protection of $\mathbf{3 5}$ as pivaloate followed by conversion of C-2 hydroxyl into azido gave 45 with inversion at C-2 center. Reduction of $\mathbf{4 5}$ afforded 46 . In an attempt to make 46 directly from 33, we tried aminohydroxylation, however it gave a complex mixture of unisolable products. Hydrolysis of acetonide in 46, followed by acetylation furnished the target compound 27 as the tetracetate 47. Similarly 28 was prepared from 41 as the tetraacetate 48 obtained in 5.45:1 ratio, following the reaction steps as in Scheme 6. This was separated by flash column chromatography to give 48 in diastereomerically pure form. Similarly diastereomeric mixtures 39 and 42 were converted into 49 and 50 ( $33 \%$ de) respectively.

Thus, we have exploited the concept of double diastereoselection in SAD reaction and applied the results obtained toward the synthesis of four of the eight isomers of phytosphingosine.

## Chapter 4: Enantioselective Synthesis of Chiral Epoxides via Asymmetric

Dihydroxylation: Synthesis of (+)-Diolmycin A2 and (+)- and (-)Posticlure.

Epoxides are versatile intermediates in organic synthesis, while many bioactive molecules contain the epoxide function as well. This chapter describes methods to convert a chiral diol into epoxide intermediate which is further extrapolated towards the asymmetric synthesis of (+)-diolmycin A2 and both enantiomers of posticlure. This chapter is divided into two sections.

## Section A: Enantioselective Synthesis of (+)-Diolmycin A2

With a search for new anticoccidial agents, Omura and coworkers isolated diolmycin A1, A2, B1, and B2 (51-54) from a fermentation broth of Streptomyces sp.WK-2955. ${ }^{9}$ Omura et
al. ${ }^{10}$ reported the first total synthesis of Diolmycin A1 51 as the racemate and then reported an asymmetric synthesis. ${ }^{11}$

51 Diolmycin A1

52 Diolmycin A2

53 Diolmycin B1

54 Diolmycin B2

The use of chiral pool materials, such as L-tartaric acid for the preparation of diolmycin A2 52 has recently been reported by Kotsuki et al. ${ }^{12}$ Diolmycin A2 52 has threo-diol configuration which could easily be derived by asymmetric dihydroxylation. In view of this, an asymmetric synthesis of diolmycin A2 52 was undertaken as shown in Schemes 7 and 8.

Scheme 7
Thus, in Scheme 7, the asymmetric dihydroxylation of $\mathbf{5 9}$ under buffered conditions gave the dihydroxybromide, which on subsequent base treatment gave the epoxide $\mathbf{6 0}$.

Scheme 8
Alternatively, the epoxide $\mathbf{6 0}$ could be obtained from $\mathbf{5 8}$ following the reaction steps as shown in Scheme 8. The dihydroxylation of olefin 58 using the Sharpless asymmetric dihydroxylation procedure gave the diol 61. The dihydroxyl protection, ester group reduction and tosylation furnished 62. Deprotection of the acetonide and subsequent treatment with $\mathrm{K}_{2} \mathrm{CO}_{3}$ afforded the epoxide $\mathbf{6 0}$. From here, we carried out the regioselective C-3 alkylation of indole, by employing a Lewis acid, $\mathrm{SnCl}_{4}$ and a mixture of solvents like $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and $\mathrm{CH}_{3} \mathrm{NO}_{2}$. The solubility of the indole-Lewis acid complex has been greatly
increased by the use of $\mathrm{CH}_{3} \mathrm{NO}_{2}$ solvent thereby lowering the reaction time and raising the yields. The subsequent debenzylation afforded (+)-diolmycin A2 52.

Thus, a short and efficient synthesis of (+)-diolmycin A2 52 has been achieved, employing the SAD reaction and regioselective $\mathrm{C}-3$ indole coupling routes.

## Section B: Enantioselective Synthesis of (+)- and (-)-Posticlure

Wakamura et al. ${ }^{13}$ isolated for the first time in the history of epoxide pheromones a novel trans-epoxide pheromone from the virgin females of the tussock moth, Orgyia postica and identified it as $(6 Z, 9 Z, 11 S, 12 S)$-trans-11,12-epoxyhenicosa-6,9-diene 63a and named it as posticlure after the species name. Wakamura et al. ${ }^{13}$ also reported the first synthesis by employing Sharpless asymmetric epoxidation reaction and obtained the pheromone only in $59 \%$ ee. The pure sample was obtained by preparative HPLC.

(-)-Posticlure 63a

(+)-Posticlure 63b

Since a chiral diol obtained by SAD reaction can be converted into an epoxide stereospecifically, ${ }^{14}$ we designed an asymmetric synthesis of both enantiomers of posticlure by employing SAD reaction and one-pot epoxidation as shown in Schemes 9-11.

Scheme 9. (Z) $-\mathrm{C}_{5} \mathrm{H}_{11} \mathrm{CH}=\mathrm{CHCH}_{2} \mathrm{CH}_{2} \mathrm{P}^{+} \mathrm{Ph}_{3} \mathrm{I}^{-} \mathbf{6 8}$
In Scheme 9, the intermediate diol 69 is synthesized. Asymmetric dihydroxylation of 65, followed by dihydroxyl protection and reduction of ester gave 67. Oxidation of alcohol and subsequent Wittig reaction with 68 followed by acetonide deprotection furnished 69. Similarly the enantiomer of 69 i.e. 70 was synthesized by $\beta$-dihydroxylation of olefin 65 and following the same route as for 69 .

Alternatively, the diols 69 or 70 were synthesized by selective mono-dihydroxylation of a triene system like 72 as shown in Scheme 10. Selective mono- $\alpha$-dihydroxylation of 72 gave 69 , while mono- $\beta$-dihydroxylation gave 70.

Scheme 10
The diol 69 was converted into the epoxide pheromone $(-)$-posticlure 63a via bromoester intermediates 74 as shown in Scheme 11. Similarly the diol 70 was converted into the enantiomer of 63a i.e. 63b.

Scheme 11
Thus, a highly enantioselective synthesis of both enantiomers of a novel first transepoxide pheromone posticlure has been achieved.

## Chapter 5: A new PCC Mediated Unusual C-C Bond Cleavage During Oxidation of Homobenzylic Alcohols Leading to Benzylic Carbonyl Compounds.

Pyridinium chlorochromate (PCC) is a well-known oxidizing agent, converting alcohols to aldehydes or ketones with high efficiency. ${ }^{15}$ Several rearrangements and useful conversions are known with PCC. All these make PCC a versatile oxidant in organic synthesis. ${ }^{16}$

While working on the total synthesis of diolmycin A2, the oxidation of homobenzylic alcohol 57 under Swern oxidation conditions gave the expected aldehyde 75. However when PCC was employed as an oxidant (1.5 equivalents), a mixture of 76 and 75 was obtained in 75:25 ratio. When PCC ( 3 equivalents) was used, the aldehyde 76 was the only product with no trace of 75 .

Thus, there is scission of $\mathrm{C}-\mathrm{C}$ bond leading to the loss of one carbon atom and yet, to add to our enthusiasm the end product is an aldehyde without further oxidation. Several homobenzylic alcohols irrespective of aryl substituents and having no benzylic substitution on oxidation with PCC (3 equivalents), afforded the benzylic aldehydes in moderate to good yields. In order to understand better the scope of this oxidation, we elaborated the reaction on homobenzylic alcohols with substitution at benzylic position such that if degradation occurred, the end product would be a ketone. Indeed, this oxidation gave ketone as the only compound. Several such compounds are also covered in this chapter.

To elaborate further, when homoallylic alcohols were oxidized under similar conditions no degradation of carbon was observed. However the migration of double bond to $\alpha, \beta$-position of carbonyl compound was observed. While in some cases 1,4-dicarbonyl-2E-ene products were formed from further allylic oxidation.

This kind of migration is not possible with homobenzylic alcohols, as it would destroy aromaticity. Both results are complementary and are new additions to the plethora of reactions brought about by PCC. This method should find widespread application in organic synthesis.

## CHAPTER 1

## ASYMMETRIC DIHYDROXYLATION

AND CYCLIC SULFITES/SULFATES AS SYNTHETIC INTERMEDIATES

### 1.1. ASYMMETRIC DIHYDROXYLATION (SAD)

### 1.1.1. Introduction

Nature, an architect par excellence, produces hundreds of compounds through a variety of biogenetic pathways and quite a few of them have attracted the synthetic organic chemist's attention due to their remarkable structural features and/or the conferred specific bioactivity. Asymmetric synthesis of bioactive molecules is in the forefront of synthetic organic chemistry due to its varied applications in drug and pharmaceutical industries and biotechnologies.

In the last two decades, many powerful asymmetric reactions have emerged as a result of the growing need to develop efficient and practical syntheses of biologically active compounds. Catalytic asymmetric reactions provide an especially practical entry into the chiral world due to their economical use of asymmetric inducing agents. ${ }^{1}$ Especially useful is the carbon-heteroatom bond forming reaction, since the resulting functionality can be readily manipulated to produce many important classes of compounds. It is not surprising, therefore, that the oxidative addition of heteroatoms to olefins has been a fruitful area in recent years (Scheme 1).

Scheme 1. Transition metal mediated suprafacial 1,2-difunctionalization of olefins.

A number of transition metal-mediated methods for the epoxidation, ${ }^{2}$ oxidative cyclization, ${ }^{3}$ halohydrin formation, ${ }^{4}$ dihydroxylation ${ }^{5}$ and aminohydroxylation ${ }^{6}$ have emerged. A common feature of most of these processes is the phenomenon of ligand acceleration, ${ }^{7}$ wherein a metalcatalyzed process turns over faster in the presence of a co-ordinating ligand (Scheme 2). This causes the reaction to be funneled through the ligated pathway with the additional consequence
that the ligand may leave its 'imprint' on the selectivity determining step. Hence, the ligand can influence the chemo-, regio-, and stereoselectivity of the reaction in a profound way.

Scheme 2. Ligand accelerated catalysis-dihydroxylation of olefins. ${ }^{7}$
The osmium tetroxide-catalyzed asymmetric dihydroxylation (AD) of olefins, embedding two hydroxyl groups in a hydrocarbon framework is perhaps one of the most reliable and selective transformations in organic chemistry. In his pioneering work on the stoichiometric reaction of $\mathrm{OsO}_{4}$ with olefins, Criegee ${ }^{8}$ showed that pyridine accelerated the reaction considerably. However, cost considerations made the stoichiometric osmylation uneconomical. Not surprisingly, catalytic variants of the reaction, which employ relatively inexpensive reagents for the re-oxidation of the osmium (VI) glycolate products, greatly enhance its synthetic utility. ${ }^{5 b}$ Inorganic co-oxidants such as sodium or potassium chlorate ${ }^{9 \mathrm{a}}$ or hydrogen peroxide, ${ }^{9 b, c}$ were among the first to be introduced, but in some cases diminished yields resulted due to overoxidation. Much better results were obtained with alkaline $t$ - BuOOH , introduced by Sharpless and Akashi, ${ }^{10}$ or N -methylmorpholine N -oxide (NMO) (Upjohn Process). ${ }^{11}$ Tsuji et al. ${ }^{12}$ demonstrated that $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}$ in the presence of $\mathrm{K}_{2} \mathrm{CO}_{3}$ provides a powerful system for the osmium-catalyzed dihydroxylation of olefins.

Initial efforts by Sharpless and Hentges to induce enantioselectivity in the osmylation with chiral pyridine derivatives failed due to the low affinity of these ligands for $\mathrm{OsO}_{4}{ }^{13}$ It was found that the binding constant of a ligand is extremely sensitive to the steric hindrance near the reacting center. Consequently, quinuclidine derivatives were used instead of pyridines for further investigations due to their intrinsically higher affinity for $\mathrm{OsO}_{4} .{ }^{14}$ Moderate to good enantiomeric excess using acetate esters of cinchona alkaloids as chiral ligands was obtained. ${ }^{13}$

Apart from the cinchona alkaloid catalyzed AD , there are a number of methods employing chiral monodentate ${ }^{15}$ and bidentate diamine ${ }^{16}$ ligands. Despite the good to excellent
enantioselectivities that can be obtained with diamine ligands, a serious drawback results from their bidentate nature, that they form very stable chelate complexes with Os (VI) glycolate products and as a consequence prevent in situ recycling of the Os and the ligand. Thus, all the reactions involving bidentate ligands are stoichiometric in both $\mathrm{OsO}_{4}$ and the chiral ligand ${ }^{16}$ (Figure 1).

Figure 1. Some ligands for AD reaction. ${ }^{13,16}$

Initially, the asymmetric dihydroxylation using the derivatives of cinchona alkaloids was performed under stoichiometric conditions, but in 1987 Marko and Sharpless ${ }^{17}$ found that the process became catalytic when NMO was employed as the co-oxidant. However, the enantiomeric excess of the diol products obtained under these catalytic conditions was initially lower than that produced by the stoichiometric reaction. The origin of this discrepancy was found to be the presence of a second catalytic cycle, ${ }^{18}$ (Figure 2) which exhibited only low or no enantioselectivity. Wai ${ }^{18}$ discovered a partial remedy in slow addition of the olefin. Kwong ${ }^{19}$ found that the participation of second catalytic cycle can be virtually eliminated by performing the reaction under two-phase conditions with $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}$ as the stoichiometric re-oxidant. Under these conditions there is no oxidant other than $\mathrm{OsO}_{4}$ in the organic layer, in contrast to the homogeneous NMO conditions. Since the actual osmylation takes place in this layer, the resulting osmium (VI) monoglycolate ester undergoes hydrolysis, releasing the diol and the ligand to the organic layer and $\mathrm{Os}(\mathrm{VI})$ to the aqueous layer before its regeneration can occur, and consequently entry of the osmium glycolate into the second cycle is prevented (Figure 3).

Figure 2. Two Catalytic Cycles for the AD Reaction using NMO as the Co-oxidant. ${ }^{18}$

Figure 3. Catalytic Cycle of the AD Reaction with $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}$ as the Co-oxidant. ${ }^{19}$

Sharpless et al. ${ }^{20}$ found that the hydrolysis of the osmium (VI) glycolate product could be accelerated considerably by using $\mathrm{MeSO}_{2} \mathrm{NH}_{2}$. The reaction time can be as much as 50 times shorter in the presence of this additive. This allows high catalytic turnover even with sterically encumbered substrates, and tetra substituted olefins are now within the scope of the reaction. Due to this "sulfonamide effect", most AD reactions can be carried out at $0^{\circ} \mathrm{C}$ rather than at room temperature, which may have beneficial influence on the selectivity. ${ }^{21}$ For terminal olefins, $\mathrm{MeSO}_{2} \mathrm{NH}_{2}$ is not recommended. Surprisingly, terminal olefins actually react slower in the presence of $\mathrm{MeSO}_{2} \mathrm{NH}_{2}$. However this weak inhibitory effect is noticeable only if very small amount of $\mathrm{OsO}_{4}(0.2 \mathrm{~mol} \%)$ is employed.

The discovery of ligands with two independent cinchona alkaloid units by Hartung ${ }^{20}$ (phthalazine core) and Crispino ${ }^{22}$ (diphenylpyrimidine core) attached to a heterocylic spacer, has led to a considerable increase in both the enantioselectivity and the scope of the reaction (Figure 4).

### 1.1.2. The Mechanism of Asymmetric Dihydroxylation (AD)

The osmium-catalyzed dihydroxylation reaction has been the center of extensive mechanistic investigations and two different mechanisms have been suggested. Boseken ${ }^{23 a}$ and Criegee ${ }^{8}$ originally proposed a concerted [3+2] pathway, (Scheme 3, Path A) while Sharpless et al. ${ }^{23 \mathrm{~b}}$ and Jorgensen et al. ${ }^{23 \mathrm{c}}$ suggested a stepwise reaction which is initiated by a [2+2] like addition of the olefin across an $\mathrm{Os}=\mathrm{O}$ bond (Path B), followed by rearrangement of the resulting osmaoxetane intermediate to the glycolate product.

Scheme 3. Schematic presentation of the concerted [3+2] mechanism ${ }^{23 a}$ (Path A) and the stepwise osmaoxetane mechanism (Path B). ${ }^{23 b, c}$

The recent observation of a nonlinear Erying relationship between enantiomeric excess and temperature ${ }^{21}$ is consistent with Criegee's one-step [3+2] mechanism, but it can be explained by a reaction pathway with at least two selectivity determining steps which are weighted differently according to temperatures owing to their different activation parameters, $\Delta \mathrm{H}$ and $\Delta \mathrm{S}$. Hence, this observation suggests that the stepwise [2+2]-like mechanism is operative. High level ab initio calculations have indeed shown that osmaoxetanes are energetically accessible minima on the potential energy surface. ${ }^{24}$

### 1.1.3. Empirical Rules for Predicting the Face Selectivity

Despite the mechanistic uncertainties, the face selectivity of the dihydroxylation can reliably be predicted using an empirical 'mnemonic device' (Scheme 4). ${ }^{25}$ The plane of the olefin is divided into four quadrants and the substituents are placed into three quadrants according to a simple set of rules. The SE quadrant is sterically inaccessible and, with few exceptions, no substituent other than hydrogen can be placed here. The NW quadrant, lying diagonally across from the SE quadrant, is slightly more open and the NE quadrant appears to be quite spacious. The SW quadrant is special in that its preferences are ligand-dependent. Even though this SW quadrant normally accepts the largest group, especially in the case of PYR ligands, it is especially attractive for aromatic groups in the case of PHAL ligands. ${ }^{25 c}$ An olefin, which is placed into this plane according to the above constraints, receives the two OH groups from above, i.e. from the $\beta$-face, in the case of DHQD derived ligands and from the bottom, i.e. from the $\alpha$-face, in the case of DHQ derivatives.

Scheme 4. The mnemonic device for predicting the face selectivity.

Predictions for 1,1-disubstituted olefins using the empirical mnemonic device are not always unambiguous, ${ }^{26}$ since it may be difficult to judge which of the two substituents prefer the attractive, SW quadrant. Along with steric size, the properties of the substituents have also to be taken into account and compared with the ligand-specific preferences for the SW quadrant. PHAL ligands show the following preferences for the SW quadrant: ${ }^{25 c}, 26,27$

Aromatic groups $\gg n$-alkyl $>$ branched alkyl $>$ oxygenated residues
Recent studies have revealed that oxygenated residues ${ }^{26,28}$ have very small preferences for ligands binding pocket (SW quadrant). Studies with 1,1-disubstituted olefins have shown that pyrimidine (PYR) ligands have very different preferences for SW quadrant ${ }^{25 c, 27}$ and the steric size of a substituent is much more important than in the PHAL system. Thus, the following preference is observed:

Branched alkyl $>$ long $n$-alkyl (length $\geq 3$ ) $>$ aromatic residues $>$ short $n$-alkyl
A few exceptions mostly for terminal olefins have appeared in recent years. The AD of certain ortho-substituted allyl benzenes in the presence of PHAL ligands have been shown to give facial selectivities opposite to those predicted by the mnemonic device. ${ }^{29}$ Furthermore, trans-olefins in the same series react with the expected face selectivity even with the PHAL ligands; thereby demonstrating that exceptions are so far limited to the class of terminal olefins. Thus, the mnemonic device is a simple tool for predicting the facial selectivity of the AD reaction. However, reliable predictions require the intrinsic preference of each ligand to be taken into account. Thus, the SW quadrant is especially attractive for aromatic groups in the PHAL systems, while aliphatic groups are preferred in the PYR systems. PYR ligands are, therefore the ligands of choice for aliphatic and/or sterically congested olefins, while PHAL ligands are better for aromatic substrates. These simple rules allow the prediction of the face selectivities even in difficult cases and very few exceptions are known.

### 1.1.4. Reaction Conditions

Catalytic asymmetric dihydroxylation is performed in a $1: 1$ mixture of water and $t$ - BuOH . The olefin concentration in the $t-\mathrm{BuOH} /$ water mixture is usually $0.1 \mathrm{M} .{ }^{20}$ While the reaction is normally run under basic conditions $\left(\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{pH} 12.2\right.$, aq. layer $),{ }^{30}$ it is possible to buffer the system with 3 equivalents of $\mathrm{NaHCO}_{3}(\mathrm{pH} 10.3$, aq. layer). Buffering of the reaction has a beneficial effect on the yield when base-sensitive substrates are used or base-sensitive products are formed. Normally the reaction is performed with 3 equivalents of $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}$ as the re-
oxidant. The key reagents used are the Os reagent and the ligands. Only 0.2 to $0.4 \mathrm{~mol} \%$ of Os reagent, either $\mathrm{OsO}_{4}$ or the nonvolatile $\mathrm{K}_{2} \mathrm{OsO}_{2}(\mathrm{OH})_{4}$ is added. The ligand concentration is 1 $\mathrm{mol} \%$. However it can be dropped in some cases without much loss in enantioselectivity. For e.g. stilbene still gives $96 \%$ ee when $1 / 100$ of $1 \mathrm{~mol} \%$ of (DHQD) $)_{2}$-PHAL is used as compared to the $99.8 \%$ ee obtained under normal conditions. ${ }^{20}$ Alternatively, the amount of $\mathrm{OsO}_{4}$ can be increased to $1 \mathrm{~mol} \%$ for accelerating the reaction rate of relatively unreactive olefins. Additionally, the ligand can be recovered especially when large-scale reactions are carried out. For the PHAL ligands, the combined organic layers are extracted with $3 \%$ aq. $\mathrm{H}_{\underline{L}} \mathrm{SO}_{4}$ saturated with $\mathrm{K}_{2} \mathrm{SO}_{4}$ (ca. $40 \mathrm{~mL} / 1 \mathrm{~g}$ of ligand), followed by a second extraction of the organic solution with saturated $\mathrm{K}_{2} \mathrm{SO}_{4}$ (ca. $40 \mathrm{~mL} / 1 \mathrm{~g}$ of ligand). The ligand enters the aqueous phase as the hydrogen sulfate salt and the solution can be reused directly for the subsequent AD reactions without further purification. However, the amount of $\mathrm{K}_{2} \mathrm{CO}_{3}$ in the subsequent reaction should be increased in order to neutralize excess $\mathrm{H}_{2} \mathrm{SO}_{4}$ and also to release the ligand salt as its free base. Additionally, the amount of water should be decreased by the volume of aqueous ligand solution added to the reaction mixture.

Since most substrates require very similar reaction condition, it is possible to use premix of all reactants. These are available commercially as 'AD-mixes' such as AD-mix- $\beta$ [(DHQD) $)_{2} \mathrm{PHAL}$ ] and $\mathrm{AD}-$ mix- $\alpha$ [(DHQ) $\left.)_{2} \mathrm{PHAL}\right] .1 \mathrm{~kg}$ of AD -mix contains $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}$ (699.6 $\mathrm{g}), \mathrm{K}_{2} \mathrm{CO}_{3}(293.9 \mathrm{~g})$, ligand $(5.52 \mathrm{~g})$ and $\mathrm{K}_{2} \mathrm{OsO}_{2}(\mathrm{OH})_{4}(1.04 \mathrm{~g})$. The standard AD procedure calls for 1.4 g of this AD -mix per mmol of olefin. One equivalent of $\mathrm{MeSO}_{2} \mathrm{NH}_{2}$ should be added for all substrates other than terminal olefins to enhance hydrolysis of the osmate (VI) ester and hence the rate of catalytic turnover.

### 1.1.5. The Cinchona Alkaloid Ligands and their Substrate Preferences

## Phthalazine (PHAL) ligands

The phthalazine ligands are most widely used, due to their ready availability and their broad substrate scope. ${ }^{25 b}$ This ligand class is used in the AD-mix formulation. PHAL ligands react especially well when aromatic groups are present, and remarkably high enantioselectivities are observed when the aromatic substituents appear in certain optimal locations/patterns. ${ }^{25 a}$ One such case is trans-stilbene for which the enantioselectivity is as high as $99.8 \%{ }^{31}$ However, PHAL ligands give inferior results with aliphatic olefins, especially if they are branched near the double bond or if they have very small substituents.

Recent developments have provided ligands with even broader scope than that of the PHAL derivatives.

## Anthraquinone (AQN) ligands

The anthraquinone ligands are especially well suited for almost all olefins having aliphatic substituents. ${ }^{32}$ Even diols derived from allyl halides or allyl alcohols can now be obtained with satisfactory enantiomeric purity, thereby giving access to valuable chiral building blocks. The $A Q N$ derivatives are the ligands of choice for the $A D$ reaction, except for olefins with aromatic or sterically demanding substituents.

## Pyrimidine (PYR) ligands

The pyrimidine ligands are the ligands of choice for olefins with sterically demanding substituents. ${ }^{22}$

## Diphenyl pyrazinopyridazine (DPP) and diphenyl phthalazine (DP-PHAL) ligands

These ligands give improved enantioselectivities for almost all olefins except for terminal alkyl olefins which are better served by the AQN or PYR ligands. ${ }^{33}$ Even cis-1,2-disubstituted olefins give improved face selectivities with these ligands. The DPP ligand is normally slightly superior to the DP-PHAL ligand. The DPP derivatives are the optimal ligands for aromatic olefins and for certain cis-1,2-disubstituted olefins.

## Indoline (IND) ligands

Cis-1,2-disubstituted olefins generally are poor substrates for the AD reaction and the IND derivatives are normally the ligands of choice. ${ }^{34}$ However, in certain cases better results are obtained with the new second generation ligands. ${ }^{32,33,35}$

### 1.1.6. Recent Applications of Sharpless Asymmetric Dihydroxylation (SAD) Reaction in Organic Synthesis

Asymmetric dihydroxylation offers some important advantages over the use of chiral pool materials in enantioselective synthesis.

1] SAD , catalytic in both $\mathrm{OsO}_{4}$ and the chiral ligand, provides either enantiomer of the product.
2] SAD is not limited to a certain number of standard starting materials (e.g. carbohydrates, tartrates, etc.), since virtually any olefin can be regarded as a substrate. 3] Third, most enantiospecific syntheses from the chiral pool require an elaborate protecting group strategy. However with SAD, the diol can be carried through the synthesis "masked" as an olefin, ready to be released at any point.

In most instances, diols are not the final products and their synthetic elaboration requires some further transformations. Commonly, these involve the selective manipulation of one of the two OH groups either by protecting it or by converting it into a leaving group, suitable for displacement by a nucleophile. Over the last decade, several applications of SAD reaction in the syntheses of bioactive molecules and natural products have been documented in the literature. While most synthetic applications of SAD are covered in the review article by Sharpless et al., ${ }^{5 \mathrm{a}}$ a few recent applications are documented below.

1. Boronolide $4,{ }^{36}$ has been synthesized employing the SAD reaction on enyne $\mathbf{1}$, followed by a second SAD reaction on cis-olefin 3 (Scheme 5).

Scheme 5
2. A short synthesis of (-)-pestalotin $7,{ }^{37}$ is achieved through the SAD of enyne $\mathbf{5}$ (Scheme 6).

3. The phytoalexin, (+)-pisatin $11,{ }^{38}$ is synthesized by SAD reaction of cyclic olefin 9 (Scheme 7).

Scheme 7
4. Kitahara et al. ${ }^{39}$ employed SAD of trans-olefin $\mathbf{1 2}$ in the asymmetric synthesis of both enantiomers of Hiburipyranone 14, a cytotoxic metabolite of a marine sponge Mycale adhaerens (Scheme 8).

5. The first total synthesis of naturally occurring (+)-Uvaricin $\mathbf{2 0}^{40}$ is achieved using three consecutive SAD reactions to place the necessary oxygen functions on a naked carbon skeleton in a regio- and enantiocontrolled manner (Scheme 9).

Scheme 9
6. Similarly, the analogs of Uvaricin, i.e. Squamotacin $\mathbf{2 1}^{41}$ and Bullatacin $\mathbf{2 2}^{\mathbf{4 1}}$ are also synthesized employing the same strategy.

7. A novel cytokine modulator cytoxazone $\mathbf{2 6}^{42}$ has been synthesized employing SAD and cyclic sulfite intermediate 25 (Scheme 10).

Scheme 10
8. The first synthesis of $(2 S, 3 R, 5 S)$-(-)-2,3-dihydroxytetradecan-5-olide 31, ${ }^{43}$ a new biologically active $\delta$-lactone produced by Seiridium unicorne is accomplished using ( $R$ )-malic acid and employing the SAD reaction (Scheme 11).

Scheme 11
9. SAD is successfully employed in the synthesis of antitumor agent panaxytriol $\mathbf{3 4}$ and its diastereomers ${ }^{44}$ from olefin 32 (Scheme 12).

Scheme 12
10. The intermediate acid $\mathbf{3 8}^{45}$ for the synthesis of depsipeptide hapalosin 39, has been arrived at through SAD reaction of allylic chloride 35 (Scheme 13).

Scheme 13
11. An efficient synthesis of trans-(+)-laurediol $\mathbf{4 2}^{46}$ has been achieved by SAD reaction of olefin 40 to give the intermediate $\beta$-hydroxy- $\gamma$-lactone 41 which is then extrapolated to 42 (Scheme 14).

Scheme 14
12. The synthesis of C1-C12 fragment $\mathbf{4 6}^{47}$ of fostriecin $\mathbf{4 7}$ has been achieved through SAD reaction and ring closing metathesis (Scheme 15).

Scheme 15
13. Regioselective SAD and stereoselective reduction routes have been applied towards the asymmetric synthesis of pinellic acid $\mathbf{5 1},{ }^{48}$ a potent oral adjuvant for nasal influenza vaccine (Scheme 16).

Scheme 16

### 1.1.7. Conclusion

Thus, SAD reaction has become a powerful catalytic oxidation reaction. With the optimization of ligands and the amount of primary oxidant, this catalytic oxidation reaction of olefins to chiral diols is proving very promising in terms of both yields and enantioselectivities. It has contributed to rapid advances in synthetic organic chemistry giving access to new molecules needed to investigate hitherto unexplained and undiscovered phenomena in the molecular world.

### 1.2. CYCLIC SULFITES/SULFATES AS SYNTHETIC INTERMEDIATES

### 1.2.1. Introduction

Cyclic sulfate esters have been known since $1932 .{ }^{49}$ However, the lack of an efficient method for their preparation limited their applications in the repertoire of main line organic synthesis. But the improved process of converting the diol into cyclic sulfite with thionyl chloride, followed by oxidation of cyclic sulfite with $\mathrm{NaIO}_{4}$ catalyzed by $\mathrm{RuO}_{4}{ }^{50}$ (generated in situ, using $\mathrm{RuCl}_{3} .3 \mathrm{H}_{2} \mathrm{O}$ ) represents an important development that broadened the use of cyclic sulfates as important synthetic intermediates. The advent of SAD reaction provided a route to chiral 1,2diols from a wide spectrum of olefins, which can further be elaborated to cyclic sulfates. ${ }^{51}$ Cyclic sulfites/sulfates have the following important features.

1] They have high reactivity toward various nucleophiles and are more reactive than epoxides.
2] They can activate nucleophilic attack at one position while serving as a protecting group at a second position; under vigorous conditions they can serve as an activator for two sequential reactions. 3] Reactions of five-membered cyclic sulfates with nucleophiles provide two contiguous stereocentres; moreover, a remote stereocenter can be controlled by cyclic sulfates of 1,3- and 1,4-diols. 4] The intermediate of substitution is generally a salt of monosulfate ester, probably enabling separation of the product from the non-salt by-product.

### 1.2.2. Preparation of Cyclic Sulfites/Sulfates

While several methods for preparation of cyclic sulfite are known, the most efficient synthesis involves the reaction of diol with thionyl chloride ${ }^{52}$ or transesterification of a dialkyl sulfite with a diol ${ }^{53}$ (Scheme 17).

Scheme 17
In most reactions, expelling of hydrogen chloride by either refluxing ${ }^{54}$ or using a stream of nitrogen improve the yield. In case of substrates with an acid-labile functionality, a base such as $\mathrm{Et}_{3} \mathrm{~N}$, imidazole or pyridine is used to scavenge the hydrogen chloride generated during the reaction ${ }^{55}$ (Scheme 18).

Scheme 18
Cyclic sulfate can be prepared directly by reaction of diol with sulfuryl chloride $\left(\mathrm{SO}_{2} \mathrm{Cl}_{2}\right)$, but this gives only moderate yields due to the chlorinating nature of $\mathrm{SO}_{2} \mathrm{Cl}_{2}{ }^{56}$ (Scheme 19).

Scheme 19
Oxidation of cyclic sulfites to sulfates is another alternative. Use of stoichiometric amount of $\mathrm{RuO}_{4}$ gave cyclic sulfates in satisfactory yield. ${ }^{57}$ However, this procedure is limited to smallscale preparations due to the expensive $\mathrm{RuO}_{4}$. The discovery that a catalytic amount of $\mathrm{RuO}_{4}$ is generated in situ by the reaction of $\mathrm{RuCl}_{3}$ or $\mathrm{RuO}_{2}$ with $\mathrm{NaIO}_{4}$ made available an expedited route for the oxidation of cyclic sulfites to sulfates ${ }^{50}$ (Scheme 20).

Scheme 20

### 1.2.3. Reactions of Cyclic Sulfites/Sulfates

Analogous to epoxides, cyclic sulfites/sulfates can be opened by attack of a nucleophile at either carbon center giving a sulfite/sulfate monoester. These monoesters allow some interesting transformations, which make the chemistry of cyclic sulfites/sulfates more versatile than of epoxides. Hydrolysis of the monoesters leads to hydroxy compounds that parallel those obtained from oxiranes. ${ }^{50}$ However, the sulfate monoester can function as a leaving group, leading to disubstitution products ${ }^{50}$ (Scheme 21).

Scheme 21
Cyclic sulfites and especially sulfates react with a variety of nucleophiles and a few examples are $\mathrm{Cl}(\mathrm{LiCl}),{ }^{58} \mathrm{Br}^{-}\left(\mathrm{NH}_{4} \mathrm{Br}\right),{ }^{58} \mathrm{~F}^{-}\left(\mathrm{Et}_{4} \mathrm{NF} .2 \mathrm{H}_{2} \mathrm{O}, n-\mathrm{Bu}_{4} \mathrm{NF}\right),{ }^{50,59} \mathrm{~N}_{3}{ }^{-}\left(\mathrm{LiN}_{3}, \mathrm{NaN}_{3}\right),{ }^{50,55,59,60,61,62}$ $\mathrm{RNH}_{2},{ }^{60,63} \mathrm{PhCO}_{2}{ }^{-}\left(\mathrm{PhCO}_{2} \mathrm{NH}_{4}\right),{ }^{50,55,59} \mathrm{ROH}^{64} \mathrm{NO}_{3}{ }^{-}\left(n-\mathrm{Bu}_{4} \mathrm{NNO}_{3}\right),{ }^{50} \mathrm{SCN}^{-}\left(\mathrm{NH}_{4} \mathrm{SCN}\right),{ }^{50,58}$ $\mathrm{PhS}^{-}(\mathrm{PhSNa}),{ }^{65} \mathrm{AcS}^{-},{ }^{66} \mathrm{H}^{-}\left(\mathrm{NaBH}_{4}, \mathrm{NaBH}_{3} \mathrm{CN}\right),{ }^{50} \mathrm{PhCH}_{2}{ }^{-}\left(\mathrm{PhCH}_{2} \mathrm{MgBr}, \mathrm{Li}_{2} \mathrm{CuCl}_{4}\right),{ }^{50} \mathrm{RC} \equiv \mathrm{C}^{-}$, $\left(\mathrm{RC} \equiv \mathrm{CSiMe}_{3}+\mathrm{MeLi}\right),{ }^{67}(\mathrm{RS})_{2} \mathrm{CH}^{-}$(with 1,4 -cyclic sulfates). ${ }^{68}$

The hydrolysis of sulfate monoesters is carried out with an equal volume of $20 \%$ aq. $\mathrm{H}_{2} \mathrm{SO}_{4}$ and ether. ${ }^{50}$ However, a chemoselective hydrolysis of sulfate ester in presence of acid-labile groups (acetonide and silyloxy) is carried out with a catalytic amount of $\mathrm{H}_{2} \mathrm{SO}_{4}$ and 0.5-1.0 equivalents of $\mathrm{H}_{2} \mathrm{O}$ in $\mathrm{THF}^{55}$ (Scheme 22). The use of a minimum of water is crucial to achieve the desired chemoselectivity. ${ }^{55}$

### 1.2.4. Recent Applications of Cyclic Sulfites/Sulfates

Several applications of cyclic sulfites/sulfates have been documented in the literature in the recent years. A few of them are described below.

1. The first asymmetric synthesis of $(2 S, 3 R)$-(-)-methanoproline $\mathbf{5 4}^{69}$ was achieved by condensation of cyclic sulfate 52 with methylbenzylidine glycinate (Scheme 23).

Scheme 23
2. Intramolecular $\mathrm{S}_{\mathrm{N}}{ }^{2}$ ring opening of a cyclic sulfate 57 has been employed in the synthesis of erythro-(-)-6-acetoxy-5-hexadecanolide $\mathbf{5 8},{ }^{70}$ a major component of mosquito oviposition attractant pheromone (Scheme 24).

Scheme 24
3. $\alpha, \beta$-Epoxyesters $(\mathbf{6 1})^{71}$ have been synthesized from cyclic sulfate (59) with the intermediate formation of 2-bromo-3-hydroxyesters (60) (Scheme 25).

$\mathrm{R}=t-\mathrm{Bu},-\mathrm{CO}_{2} i-\mathrm{Pr},-\mathrm{CH}_{2} \mathrm{OPMP}, \mathrm{C}_{15} \mathrm{H}_{31}$, $\mathrm{Ph}, c-\mathrm{C}_{6} \mathrm{H}_{11}$
Scheme 25
4. 4-Amino-5-hydroxy substituted 1,2 -oxazines $\mathbf{6 6}^{72}$ are synthesized readily from $6 H-1,2$ oxizines 62 by cis-dihydroxylation and regioselective opening of cyclic sulfate 64 with azide (Scheme 26).

Scheme 26
5. The $\mathrm{C}_{2}$-symmetric, chiral $1,1^{\prime}$-bis (phosphetano)ferrocenes $\mathbf{6 9}, \mathbf{7 0}^{73}$ have been prepared from the 1,3-diol cyclic sulfates 68 (Scheme 27). These have been tested in the rhodium-catalyzed hydrogenation of unsaturated substrates.

Scheme 27
6. (-)-( $1 R, 2 R$ )-1-Amino-2-methylcyclopropanephosphonic acid $74^{74}$ has been synthesized from (+)-(S)-1,2-propanediol cyclic sulfate 71 and dimethyl $t$-butoxycarbonyl methyl phosphonate (Scheme 28).

Scheme 28
7. Treatment of 5,6 -cyclic sulfates $\mathbf{7 5}$ derived from glycofuranoses with strong bases resulted in 6 -deoxy-hexofurano-5-ulose 78 derivatives ${ }^{75}$ (Scheme 29).

Scheme 29
8. Salacinol $\mathbf{8 2}^{76}$ has been synthesized by using the cyclic sulfate of $1,3-O$-isopropylidene-Derythritol 80 and 1,4-epithio-D-arabinitol 79 (Scheme 30).

Scheme 30
9. Cyclic sulfate $\mathbf{8 3}$ undergoes double alkylation with stabilized C,N-dianions of $\mathbf{8 4}$ to provide the piperidine ring of ( $S$ )-coniine $\mathbf{8 6}^{77}$ (Scheme 31).

Scheme 31
10. Reaction of cyclic sulfates of vic-diols (87-89) with NaOH in THF-MeOH produced the corresponding epoxides (90-92) respectively in excellent yields ${ }^{78}$ (Scheme 32).

Scheme 32
11. Cyclic sulfate 94 derived from D-mannitol 93 has been employed in the synthesis of diphosphine ligands $\mathbf{9 5}^{79}$ (Scheme 33).

Scheme 33
12. Direct coupling of purine and pyrimidine bases with the cyclic sulfate 96 derived from carbohydrate intermediate gave access to isonucleosides (97 and 98) $)^{80}$ as potential antiviral agents (Scheme 34).

Scheme 34
13. Synthesis of (+)-pancratistatin $\mathbf{1 0 3}^{81}$ has been achieved from (+)-narciclasine 99 by employing the cyclic sulfate intermediate 101 (Scheme 35).

Scheme 35

### 1.1.1. Conclusion

Thus, given the vast chemistry associated with synthetic applications of epoxides, exploration of the chemistry of 1,2-cyclic sulfites/sulfates their hitherto neglected cousins in organic synthesis is proving fruitful today. The initial realization that these intermediates are epoxidelike, but generally much more reactive has given synthetic chemists many ideas as to where they might be useful.

## CHAPTER 2

## ENANTIOSELECTIVE SYNTHESIS OF $\beta-H Y D R O X Y-\delta-L A C T O N E S$

### 2.1. Introduction

The advent of Sharpless asymmetric dihydroxylation (SAD) ${ }^{1}$ greatly facilitated the synthesis of optically active dihydroxy compounds that serve as important synthons to a vast array of natural products. The dihydroxy compounds provide varied opportunities for functional group changes to arrive at different functionalities present in the target molecules while many molecules contain the diol function as well. This chapter discloses a new approach from chiral dihydroxy compounds to $\beta$-hydroxy- $\delta$-lactones. We have employed two different strategies depending on the substrate olefin chosen for the synthesis of $\beta$-hydroxy- $\delta$-lactones. To carry out the above conversion, the cyclic sulfites/sulfates ${ }^{2}$ are employed as one of the key intermediates.

## Synthetic Strategy-1 (Scheme 1):

Here, the substrate olefin employed is a terminal olefin. Asymmetric dihydroxylation of olefin 1 gives diol 2, which is then converted into the cyclic sulfite/sulfate intermediate $\mathbf{3}$. This activates the terminal position for regioselective nucleophilic opening. Towards this end, opening of the cyclic sulfite/sulfate $\mathbf{3}$ with $\mathrm{CN}^{-}$nucleophile gives the cyano compound $\mathbf{4}$, which on subsequent hydrolysis affords the key precursor $\beta$-hydroxy acid 5. If the R group is $\mathrm{HO}-$ $\left(\mathrm{CH}_{2}\right)_{\mathrm{n}}$ - where $\mathrm{n}=1,2,--$, the lactonization reaction can afford $\beta$-hydroxy lactones $\mathbf{6}$ of varied ring size depending on the value of $n$.

Scheme 1: Synthetic strategy-1

## Synthetic Strategy-2 (Scheme 2):

Here, $\alpha, \beta$-unsaturated ester is used as a starting material. SAD of olefin 7 gives $\alpha, \beta$ dihydroxy ester 8, which is then converted into cyclic sulfite/sulfate 9 . This activates the $\alpha$ position for regioselective nucleophilic opening. Towards this end, opening of 9 with $\mathrm{H}^{-}$
nucleophile gives $\beta$-hydroxy ester 10. Hydrolysis of ester affords $\beta$-hydroxy acid 11 ( $\mathrm{R}^{\prime \prime}=\mathrm{HO}-$ $\left(\mathrm{CH}_{2}\right)_{\mathrm{n}}$-, where $\left.\mathrm{n}=1,2,----\right)$ which on subsequent lactonization would give $\beta$-hydroxy lactones 6 of varied ring size depending on the value of $n$.

Scheme 2: Synthetic strategy-2

Thus, the chiral dihydroxy compounds obtained by SAD reaction could be converted into $\beta$ hydroxy lactones of varied ring size depending on the value of $n$. When $n=1$, a $\beta$-hydroxy- $\gamma$ lactone will be formed. Similarly, $\mathrm{n}=2$ will provide a $\beta$-hydroxy- $\delta$-lactone. Other higher ring lactones could also be obtained with $n=3,4, \cdots$.

This chapter deals with the enantioselective synthesis of $\beta$-hydroxy- $\delta$-lactones employing the Sharpless asymmetric dihydroxylation and cyclic sulfites/sulfates as intermediates.

Section A details the application of the Synthetic strategy-1, where $n=2$. This gives the $\beta$ -hydroxy- $\delta$-lactone. Thus, the asymmetric synthesis of $(R)$-mevalonolactone has been achieved.

Section B details the application of the Synthetic strategy-2 toward the synthesis of the lactone portion of compactin and mevinolin.

## ENANTIOSELECTIVE SYNTHESIS OF

## (R)-(-)-MEVALONOLACTONE

### 2.2.1. Introduction

$(R)-(-)$-mevalonic acid 12, is a key intermediate in a broad spectrum of cellular biological processes and their regulation. Living systems precisely regulate the biosynthesis of mevalonate present as mevalonolactone $\mathbf{1 3}$ or mevalonic acid $\mathbf{1 2}$ (Figure 1), the essential precursor to a vast array of terpenoids, sterols, cytokines, carotenoids, isoprenoids and pentanoids. ${ }^{3}$ The transformation of 3-hydroxy-3-methylglutaryl CoA into mevalonate catalyzed by HMG-CoA reductase, is a crucial step in the biosynthesis of cholesterol. ${ }^{4}$ In medicine it is known that inhibition in the production of cellular 12 leads to lowering of plasma cholesterol. ${ }^{5}$ This makes the biological formation of $(R)-(-)$-mevalonic acid 12 an important control site. ${ }^{6 a}$ The level of $(R)-\mathbf{1 2}$ in plasma and/or urine has been used to study the mechanisms and efficacy in the treatment of hyperlipidemias and the efficacy of lovastatin as an anticancer agent. ${ }^{6}$ Thus, both for diagnostic and therapeutic reasons, simple and cheap access to natural mevalonic acid $\mathbf{1 2}$ is of significant value. As such 12, or more particularly mevalonolactone 13, have been a synthetic target of considerable interest.

12

13

14

Figure 1.
Mevalonolactone 13, was isolated from distiller's solubles as an acetate-replacing factor for Lactobacilli and identified by degradation and synthesis as 3-hydroxy-3-methyl-5-pentanolide 13 by Folkers et al. ${ }^{7,8}$ Quite independently at the same time, Tamura ${ }^{9}$ isolated from the broth of Aspergillus oryzae a growth factor for true hiochi bacteria, Lactobacillus homohiochi and Lactobacillus heterohiochi. He named it hiochic acid lactone and proposed 14 as its most probable structure. Later, Tamura revised the structure from $\mathbf{1 4}$ to $\mathbf{1 3}$ by synthesizing $\mathbf{1 3}$. ${ }^{10}$ The
identity of hiochic acid lactone with mevalonolactone was confirmed on the basis of identical IR spectra and biological activities. ${ }^{11}$ Subsequently Arigoni ${ }^{12}$ determined the absolute configuration of mevalonolactone $\mathbf{1 3}$ as $(R)$ - by correlation with quinic acid.

The ubiquity of terpenes in nature together with the preeminent position of $(R)$-mevalonic acid in the biosynthetic pathway have prompted many research groups towards the development of asymmetric synthesis of $(R)$-mevalonolactone 13 .

### 2.2.2. Review of Literature

Cornforth and co-workers were the first to prepare both enantiomers of mevalonolactone in essentially $100 \%$ optically purity from (+)- and (-)-linalool. ${ }^{13}$ Since then a number of asymmetric syntheses of $(R)-(-)$-mevalonolactone 13 have been documented in the literature. Among the chemical routes, the most important employ the Sharpless asymmetric epoxidation, ${ }^{14}$ which is a stereodifferentiating reaction. There also exist routes exploiting starting materials from the chiral pool. ${ }^{15}$ A different and highly enantioselective approach is based on chirality transcription from a chiral template. ${ }^{16}$ Other interesting synthetic methodologies involve the use of chiral sulfoxides, ${ }^{17}$ 1,3-oxathianes ${ }^{18}$ and axially dissymmetric binaphthyldiamines. ${ }^{19}$ Biocatalysts have also been used for the preparation of $\mathbf{1 3}$, either by fermentation, ${ }^{20}$ or procedures involving lipase-catalyzed kinetic resolution ${ }^{21}$ or via hydrolysis of prochiral diesters employing esterases. ${ }^{22}$

More recent methods include a chloroperoxidase catalyzed epoxidation of 3-methylbut-3enoate ${ }^{23}$ and chemoenzymatic deracemization using lyophilized cells of Nocardia E H1. ${ }^{24}$ Some of the interesting and important synthetic routes to $(R)-(-)$-mevalonolactone $\mathbf{1 3}$ are described below.

## Cornforth et al. (1962) ${ }^{13}$ Scheme 3

This report describes the first synthesis of both enantiomers in essentially $100 \%$ ee from (+)and (-)-linalool. (+)-Linalool 15 is converted into dioxane 17 through hydroboration oxidation and 1,3-hydroxyl protection. Oxidation of the free hydroxyl of $\mathbf{1 7}$ into ketone $\mathbf{1 8}$ and condensation with methylformate and NaOMe gave 19 , which was immediately oxidized by
addition of aqueous methanolic $\mathrm{NaIO}_{4}$. The acetal group was hydrolyzed during isolation of the product to afford $(R)-(-)$-mevalonolactone 13.

Scheme 3. Reaction conditions: (i) $\mathrm{LiBH}_{4}, \mathrm{BF}_{3} . \mathrm{Et}_{2} \mathrm{O}$, THF, then $\mathrm{MeOH}, 3 \mathrm{~N} \mathrm{NaOH}, 30 \% \mathrm{H}_{2} \mathrm{O}_{2}$, rt, $60 \%$. (ii) $\mathrm{CH}_{3} \mathrm{CHO}, p-\mathrm{TsOH}, \mathrm{Et}_{2} \mathrm{O}, 2 \mathrm{~d}, 81 \%$. (iii) $\mathrm{CrO}_{3}$, pyridine $3 \mathrm{~d}, 88 \%$. (iv) NaOMe , $\mathrm{HCO}_{2} \mathrm{Me},-15^{\circ} \mathrm{C}$-rt, then $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$ in $\mathrm{Et}_{2} \mathrm{O}$. (v) $\mathrm{NaIO}_{4}, \mathrm{H}_{2} \mathrm{O}, \mathrm{MeOH}, 49 \%$.

## Sih et al. (1975) ${ }^{22}$ Scheme 4

Sih and co-workers employed a chemoenzymatic route to $(R)$ - and $(S)$-mevalonolactone. $\beta$ -Hydroxy- $\beta$-methyl dimethylglutarate (20) was hydrolyzed with pig liver esterase to give the half ester 21. Reduction of $\mathbf{2 1}$ with $\mathrm{LiBH}_{4}$ or Na in liq. $\mathrm{NH}_{3}-\mathrm{EtOH}$ afforded $(R)$-mevalonolactone 13.

Scheme 4. Reaction conditions: (i) Pig liver esterase, 0.1 M phosphate buffer, $\mathrm{pH} 8,25^{\circ} \mathrm{C}, 62 \%$. (ii) $\mathrm{LiBH}_{4}, 81 \%$ or Na in liq. $\mathrm{NH}_{3}-\mathrm{EtOH}, 73 \%$.

Jones et al. (1977) ${ }^{25}$ Scheme 5
Jones and Irwin carried out oxidation of 22 with horse liver alcohol dehydrogenase (HLADH) for 23 h at pH 9 and $\mathrm{NAD}^{+}$co-enzyme recycling to give a mixture of hemiacetal 23 ( $82 \%$ ), (S)mevalonolactone (+)-13 (4\%) and residual 22 (7\%) as determined by GLC. Silver oxide
oxidation of the mixture gave (S)-mevalonolactone (+)-13. Thus, this synthesis involves the unnatural isomer of mevalonolactone.

Scheme 5. Reaction conditions: (i) $\mathrm{HLADH}, 20^{\circ} \mathrm{C}, \mathrm{pH} 9, \mathrm{NAD}^{+}$recycling, $23 \mathrm{~h},(23,82 \%$; (+)13, $4 \% ; 22,7 \%$ ). (ii) (a) $\mathrm{Ag}_{2} \mathrm{O}, 20^{\circ} \mathrm{C}, 28 \mathrm{~h}$, (b) $12 \mathrm{~N} \mathrm{HCl}, \mathrm{pH} 3,80 \%$.

## Sih et al. (1978) ${ }^{17}$ Scheme 6

Sih and co-workers employed chiral sulfoxide 25 in the synthesis of $(R)$-mevalonolactone 13. Reaction of the anion of 25 with ketone 24 gave the diastereomeric alcohol 26. Removal of sulfoxide group afforded 27. Deprotection of THP ether and lactonization gave 13. However, the enantiomeric purity of $\mathbf{1 3}$ obtained was only $17 \%$.

Scheme 6. Reaction conditions: (i) $t$ - BuMgCl , THF-DME (2:1), $-78^{\circ} \mathrm{C}, 75 \%$. (ii) Al-foil, $3 \%$ aq. $\mathrm{HgCl}_{2}-\mathrm{THF}$ (1:3), $60^{\circ} \mathrm{C}, 87 \%$. (iii) (a) $\mathrm{AcOH}-\mathrm{H}_{2} \mathrm{O}-\mathrm{THF}$ ( $1: 1: 1$ ), $50^{\circ} \mathrm{C}, 98 \%$, (b) $15 \%$ aq. NaOH , $100^{\circ} \mathrm{C}, 3 \mathrm{~h}, 61 \%$.

## Eliel et al. (1981) ${ }^{26}$ Scheme 7

Eliel and co-workers utilized the anion of oxathiane $\mathbf{2 8}$ in reaction with acetaldehyde to give the diastereomeric alcohol 29. Oxidation of 29 and Grignard reaction with vinyl magnesium bromide gave the alcohol 31 in $90 \%$ de. Cleavage of oxathiane and reduction of intermediate aldehyde produced diol 32. The primary hydroxyl group was converted into cyanide 33.

Hydroboration oxidation of 33 , cyano group hydrolysis and lactonization afforded (R)mevalonolactone 13.

Scheme 7. Reaction conditions: (i) $n$ - $\mathrm{BuLi}, \mathrm{CH}_{3} \mathrm{CHO},-78^{\circ} \mathrm{C}, 100 \%$. (ii) Swern oxidation, $83 \%$. (iii) $\mathrm{MgCl}, \mathrm{CH}_{2}=\mathrm{CHMgBr}, \mathrm{THF},-78^{\circ} \mathrm{C}, 100 \%$. (iv) (a) $\mathrm{NCS}, \mathrm{AgNO}_{3}$, (b) $\mathrm{LiAlH}_{4}, 17 \%$. (v) (a) $p-\mathrm{TsCl}$, pyridine, $\odot \odot \mathrm{C}$, (b) KCN , $\mathrm{EtOH}-\mathrm{H}_{2} \mathrm{O}$, rt, $60 \%$. (vi) $\mathrm{BH}_{3}-\mathrm{THF}, \mathrm{NaOH}-\mathrm{H}_{2} \mathrm{O}_{2}$. (vii) (a) 3 N $\mathrm{NaOH}, 100^{\circ} \mathrm{C}$, (b) $4 \mathrm{~N} \mathrm{H}_{2} \mathrm{SO}_{4}, 30 \%$.

## Takano et al. (1984) ${ }^{27}$ Scheme 8

Takano and co-workers carried out the oxygenation of the lithium enolate generated from the known alkyl $\gamma$-lactone $\mathbf{3 5}^{28 a}$ (prepared from (S)-glutamic acid or D-mannitol) with 1.5 equivalents of $\mathrm{MoOPH}^{28 \mathrm{~d}}$ at $-78^{\circ} \mathrm{C}$ to give $\mathbf{3 6}$ by diastereoselective reaction at the less hindered face of the molecule. Reduction of $\mathbf{3 6}$ with $\mathrm{LiAlH}_{4}$, selective sulfonation of the primary hydroxyl and reduction of the tosylate produced the diol 38. Detritylation of 38 to 39 and one-pot ozonolysis, reduction and cleavage of diol afforded the lactol 41. PCC oxidation of 41 gave $(R)$ mevalonolactone 13.

Scheme 8. Reaction conditions: (i) $\mathrm{MoOPH}, \mathrm{LDA},-78^{\circ} \mathrm{C}, 63 \%$. (ii) $\mathrm{LiAlH}_{4}, \mathrm{THF}, 0^{\circ} \mathrm{C}, 100 \%$. (iii) (a) $p-\mathrm{TsCl}$, pyridine, $\not \supset \mathrm{C}, 6 \mathrm{~h}$, (b) $\mathrm{LiAlH}_{4}, \mathrm{THF}, \mathscr{O}^{\circ} \mathrm{C}$. (iv) cat. $\mathrm{HCl}, \mathrm{MeOH}, 43 \%$ from 37. (v) $\mathrm{O}_{3}, \mathrm{MeOH},-78^{\circ} \mathrm{C}, \mathrm{NaBH}_{4}$. (vi) aq. $\mathrm{NaIO}_{4}, 45 \%$. (vii) $\mathrm{PCC}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rt}, 89 \%$.

Bonadies et al. (1984) ${ }^{14 \mathrm{a}}$ Scheme 9
The Sharpless asymmetric epoxidation (SAE) reaction has been employed by Bonadies and co-workers in the synthesis of ( $R$ )-mevalonolactone. 4-Methyl-5,6-dihydropyran (42) is converted into the anhydromevalonolactone 43 by PCC oxidation. Sequential hydrolysis of lactone 43, esterification followed by silylation of hydroxyl and ester reduction furnished allylic alcohol 44. SAE of 44 using (+)-DET as the chiral catalyst gave 45. Reductive opening of oxirane $\mathbf{4 5}$ produced 46 . Oxidation of primary hydroxyl to acid followed by deprotection of silyl group and lactonization gave 13.

Scheme 9. Reaction conditions: (i) $\mathrm{PCC}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 70^{\circ} \mathrm{C}, 8 \mathrm{~h}, 85 \%$. (ii) (a) 12 N KOH , reflux, 15 min, $\mathrm{CH}_{3} \mathrm{I}$, DMF, rt, 24 h , (b) $t$ - $\mathrm{BuMe}_{2} \mathrm{Si}-\mathrm{Cl}, \mathrm{DMAP}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, (c) DIBAL-H, $\mathrm{PhCH}_{3}, 0^{\circ} \mathrm{C}$, $1 \mathrm{~h}, 55 \%$. (iii) (+)-DET, $t$ - $\mathrm{BuOOH}, \mathrm{Ti}(\mathrm{O}-i \mathrm{Pr})_{4}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-30^{\circ} \mathrm{C}, 12 \mathrm{~h}, 98 \%$. (iv) $\mathrm{LiBH}_{4}, \mathrm{THF}$, reflux, $2 \mathrm{~h}, 98 \%$. (v) (a) $\mathrm{RuCl}_{3}, \mathrm{NaIO}_{4}, \mathrm{CCl}_{4}, \mathrm{CH}_{3} \mathrm{CN}, \mathrm{H}_{2} \mathrm{O}, \mathrm{rt}, 1 \mathrm{~h}$, (b) $p-\mathrm{TsOH}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 64 \%$.

## Oda et al. (1984) ${ }^{19}$ Scheme 10

In Oda's approach, axially dissymmetric binaphthyldiamine derivatives formed by asymmetric ring opening of the cyclic anhydride 48 and 49 ring close on hydrolysis to give ( - )cis 2,4-dimethylvalerolactone 50 and (-)-mevalonolactone $\mathbf{1 3}$ in $92 \%$ and $58 \%$ enantiomeric excess respectively. Thus, the reductive alkylation of $1,1^{\prime}$-binaphthyl-2,2'-diamine [(-)-(S)-47] with 3-oxapentanedial using $\mathrm{NaCNBH}_{3}$ gave the morpholino derivative 51. An equimolar amount of 3-hydroxy-3-methyl anhydride 49 reacted with 51 to give after esterification the amide ester 52. Selective reduction of the ester group and hydrolysis gave 13 in $58 \%$ ee.

Scheme 10. Reaction conditions: (i) $\mathrm{OHCCH}_{2}-\mathrm{O}-\mathrm{CH}_{2} \mathrm{CHO}, \mathrm{NaCNBH}_{3}$. (ii) (a) 49, (b) $\mathrm{CH}_{2} \mathrm{NH}_{2}$. (iii) $\mathrm{LiBH}_{4}$, then hydrolysis, $44 \%$ from 51 .

## Mori et al. (1985) ${ }^{14 \mathrm{~b}}$ Scheme 11

Mori and co-workers employed the SAE reaction on the allylic alcohol 55 to give 56. Opening of epoxide 56 and monoacetylation produced 57. Ozonolysis of 57 and oxidative workup gave the acid 58. Acetate hydrolysis and subsequent lactonization afforded $\mathbf{1 3}$.

Scheme 11. Reaction conditions: (i) $\mathrm{CuI}, \mathrm{THF},-50^{\circ} \mathrm{C}, 88.3 \%$. (ii) (+)-DET, $\mathrm{Ti}(\mathrm{O}-\mathrm{iPr})_{4}, t$ $\mathrm{BuOOH}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-40^{\circ} \mathrm{C}$ to $-30^{\circ} \mathrm{C}, 67.8 \%$. (iii) (a) $\mathrm{LiAlH}_{4}, \mathrm{Et}_{2} \mathrm{O}, \mathrm{rt}, 83.7 \%$, (b) $\mathrm{Ac}_{2} \mathrm{O}$, pyridine, rt, $97 \%$. (iv) $\mathrm{O}_{3},-60^{\circ} \mathrm{C}$, Jones oxidation, $100 \%$. (v) (a) 2 N NaOH , rt, (b) $4 \mathrm{~N}_{2} \mathrm{SO}_{4}, 79.7 \%$.

## Eliel et al. (1985) ${ }^{15 \mathrm{a}}$ Scheme 12

In an earlier synthesis, Eliel $^{26}$ carried out the reaction of vinyl magnesium bromide with ketone 28. In this report, benzyl magnesium bromide was employed to give 59. Cleavage of the oxathiane and reduction gave $\mathbf{6 0}$. The primary hydroxyl group was converted into cyano
compound 62. Acetylation of the hydroxyl group and oxidative degradation of the phenyl ring produced the carboxylic acid 64. Reduction of acid 64 to alcohol 65 , cyanide hydrolysis and subsequent lactonization afforded $\mathbf{1 3}$ in $98 \%$ ee.

Scheme 12. Reaction conditions: (i) $\mathrm{PhCH}_{2} \mathrm{MgBr},-78^{\circ} \mathrm{C}, 98 \%$. (ii) (a) $\mathrm{NCS}, \mathrm{AgNO}_{3}$, (b) $\mathrm{NaBH}_{4}, 80 \%$. (iii) $p$ - TsCl , pyridine, $0^{\circ} \mathrm{C}, 95 \%$. (iv) $\mathrm{KCN}, \mathrm{EtOH}, 0^{\circ} \mathrm{C}$-rt, $95 \%$. (v) $\mathrm{Ac}_{2} \mathrm{O}, \mathrm{DMAP}$, $95^{\circ} \mathrm{C}, 6.5 \mathrm{~h}, 99 \%$. (vi) $\mathrm{NaIO}_{4}, \mathrm{RuCl}_{3}, \mathrm{CH}_{3} \mathrm{CN}, \mathrm{CCl}_{4}, \mathrm{H}_{2} \mathrm{O}, 70^{\circ} \mathrm{C}, 14 \mathrm{~h}, 95 \%$. (vii) $\mathrm{BH}_{3}-\mathrm{THF}$, THF, $-50^{\circ} \mathrm{C}-\mathrm{rt}, 20 \mathrm{~h}, 63 \%$. (viii) (a) $3 \mathrm{~N} \mathrm{NaOH}, 30 \%$ aq. $\mathrm{H}_{2} \mathrm{O}_{2}, 70^{\circ} \mathrm{C}, 6 \mathrm{~h}$, (b) $6 \mathrm{~N} \mathrm{HCl}, 0.5 \mathrm{~h}$, $58 \%$.

## Nozoe et al. (1989) ${ }^{29}$ Scheme 13

Nozoe and co-workers have utilized the geraniol epoxide 66. ${ }^{33}$ Ring opening of $\mathbf{6 6}$ gave 1,3diol 67. After benzylation, the $1-O$-benzyl ether 68 is subjected to double bond migration according to the procedure by Sharpless and Laurer ${ }^{30}$ to give the allylic alcohol 71. Ozonolysis of 71 and reductive work-up produced 72. Jones oxidation of $\mathbf{7 2}$ followed by hydrogenolysis, promoted lactonization to afford $\mathbf{1 3}$.

Scheme 13. Reaction conditions: (i) $\mathrm{LiAlH}_{4}, \mathrm{Et}_{2} \mathrm{O}$, reflux, $2 \mathrm{~h}, 78 \%$. (ii) $\mathrm{NaH}, \mathrm{BnBr}, \mathrm{DMF}, \mathscr{0}^{\circ} \mathrm{C}$, rt , overnight, $92 \%$. (iii) $m$ - $\mathrm{CPBA}, 7 \%$ aq. $\mathrm{NaHCO}_{3}, 0^{\circ} \mathrm{C}, 2 \mathrm{~h}$. (iv) $\left(\mathrm{PhSe}_{2}, \mathrm{NaBH}_{4}, \mathrm{EtOH}\right.$, reflux, 2 h. (v) Pyridine, $30 \%$ aq. $\mathrm{H}_{2} \mathrm{O}_{2},-15^{\circ} \mathrm{C}, 2 \mathrm{~h}, 0^{\circ} \mathrm{C}-\mathrm{rt}, 3 \mathrm{~h}, 78 \%$. (vi) $\mathrm{O}_{3}, \mathrm{MeOH}$, pyridine, $-78^{\circ} \mathrm{C}$, $\mathrm{NaBH}_{4}$, rt, 36 h, $78 \%$. (vii) Jones oxidation, $62 \%$. (viii) $5 \% \mathrm{Pd}-\mathrm{C}, \mathrm{H}_{2}, \mathrm{EtOH}, 70 \%$.

## Takano et al. (1990) ${ }^{31}$ Scheme 14

Takano and co-workers utilized ( $S$ ) - $O$-benzylglycidol 74 as the chiral building block. Treatment of 74 with methyl lithiopropiolate followed by Michael addition with lithium dimethylcuprate gave the ( $Z$ )-olefin ester 76 which cyclized spontaneously to afford the $\alpha, \beta$ -unsaturated- $\delta$-lactone 77 . Epoxidation of 77 gave rise 78 as a single epimer due to favorable streoelectronic effect of the $\alpha, \beta$-unsaturated- $\delta$-lactone system 77. Regioselective cleavage of epoxide and reduction of lactone 79 furnished the triol $\mathbf{8 0}$, which on sequential debenzylation, periodate cleavage and Jones oxidation afforded 13.

Scheme 14. Reaction conditions: (i) Methyl propiolate, $n-\mathrm{BuLi}^{2} \mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}, \mathrm{THF},-90^{\circ} \mathrm{C}, 84 \%$. (ii) $\mathrm{Me}_{2} \mathrm{CuLi}, \mathrm{THF},-70^{\circ} \mathrm{C}$. (iii) $\mathrm{NH}_{4} \mathrm{Cl}, 91 \%$. (iv) $30 \% \mathrm{H}_{2} \mathrm{O}_{2}, 6 \mathrm{~N} \mathrm{NaOH}, \mathrm{MeOH}, 70 \%$. (v) $(\mathrm{PhSe})_{2}$, $\mathrm{NaBH}_{4}, \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}, i$ - $\mathrm{PrOH}, 90 \%$. (vi) $\mathrm{LiAlH}_{4}, \mathrm{THF}, 100 \%$. (vii) (a) $\mathrm{H}_{2}, \mathrm{Pd}(\mathrm{OH})_{2}-\mathrm{C}, \mathrm{MeOH}$, (b) $\mathrm{HIO}_{4}, \mathrm{H}_{2} \mathrm{O}$. (viii) $\mathrm{H}_{2} \mathrm{SO}_{4}, \mathrm{CrO}_{3}, 79 \%$ from 80.

## Ohta et al. (1990) ${ }^{21 \mathrm{a}}$ Scheme 15

Ohta and co-workers employed lipase OF in resolving the starting material $( \pm)-\mathbf{8 2}$ to give $(R)$ 83 and (S)-84. Ozonolysis of $\mathbf{8 3}$ and reductive work-up followed by DIBAL-H reduction gave
the lactol 86. The lactol $\mathbf{8 6}$ on treatment with dithioacetal-stabilized phosphonate gave the unusual product 88 in presence of $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ instead of expected 87 probably via intramolecular Friedel-Craft type reaction. Compound 88 on hydrogenation followed by acetylation afforded 89. Thus, a carbon chain elongation was achieved with the aid of protecting group without adding any special carbon source. Ozonolysis of $\mathbf{8 9}$ and oxidative work-up gave the acid 58. Hydrolysis of acetate 58 and acidification afforded 13.

Scheme 15. Reaction conditions: (i) Lipase OF. (ii) $\mathrm{O}_{3}, \mathrm{MeOH}, \mathrm{NaBH}_{4}, 86 \%$. (iii) DIBAL-H, 84.8\%. (iv) diethyl dithioacetalphosphonate. (v) $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$, diethyl dithioacetalphosphonate. (vi) (a) $\mathrm{H}, \mathrm{Pd}-\mathrm{C}, \mathrm{AcOH}$, (b) $\mathrm{Ac}_{2} \mathrm{O}$, Pyridine, $94.4 \%$. (vii) $\mathrm{O}_{3}$, Acetone, $\mathrm{H}_{2} \mathrm{O}_{2}$. (viii) (a) aq. $\mathrm{K}_{2} \mathrm{CO}_{3}$, (b) $\mathrm{H}^{+}, 32.4 \%$ from 89 .

## Mash et al. (1991) ${ }^{15 b}$ Scheme 16

In Mash's approach, the reaction of pentenyl pyranoside 92 with iodonium bis-collidine perchlorate in the presence of $(S)$-(+)-methyl mandelate produced chromatographically separable diastereomers 93 and 94. Both were reduced with $\mathrm{LiAlH}_{4}$ to give 95 and 96 respectively. Oxymercuration-demercuration of 95 produced separable diastereomeric diols 97 and 98 . Hydrolysis of 97 gave the hemiacetal, which on subsequent oxidation afforded 13. On the other hand, treatment of 96 with $m$-CPBA produced separable diastereomeric epoxides 99 and 100. Reductive epoxide opening of 99 afforded 101, which on subsequent hydrolysis and oxidation furnished 13.

Scheme 16. Reaction conditions: (i) $\mathrm{CH}_{3} \mathrm{Li}, \mathrm{Et}_{2} \mathrm{O},-78^{\circ} \mathrm{C}, 0.25 \mathrm{~h}$. (ii) 4 penten-1-ol, PPTS, 5 h , $91 \%$. (iii) (S)-methyl mandelate, iodonium bis-collidine perchlorate, $0^{\circ} \mathrm{C}, 1 \mathrm{~h}, 36 \%$ (93), $35 \%$ (94). (iv) $\mathrm{LiAlH}_{4}, \mathrm{THF}, 0^{\circ} \mathrm{C}, 100 \%$ (95), $97 \%$ (96). (v) (a) $\mathrm{Hg}(\mathrm{OAc})_{2}, 0^{\circ} \mathrm{C}, 18 \mathrm{~h}$, (b) $\mathrm{NaBH}_{4}$, $69 \%$ (97), $9 \%$ (98). (vi) (a) $10 \%$ aq. $\mathrm{HCl}, \mathrm{THF}, 0.5 \mathrm{~h}$, (b) $\mathrm{PCC}, 3 \mathrm{~A}^{\circ}$ molecular sieves, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 7$ h, rt, 76-74\%. (vii) m-CPBA, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 0^{\circ} \mathrm{C}, 18 \mathrm{~h}, 93 \%$ (99), $7 \%$ (100).

Mioskowski et al. (1991) ${ }^{32}$ Scheme 17
Mioskowski and co-workers employed the SAE of $\mathbf{1 0 3}$ to give the epoxide 104. Reductive opening of epoxide $\mathbf{1 0 4}$ to diol $\mathbf{1 0 5}$ and iodoetherification followed by DBN-mediated dehydrohalogenation afforded 106. Ozonolysis of 106 gave (+)-mevalonolactone ( $S$ )-13.

Scheme 17. Reaction conditions: (i) Vinyl magnesium bromide, CuI, THF, $-50^{\circ} \mathrm{C}-\mathrm{rt}, 10 \mathrm{~h}, 60 \%$. (ii) $\mathrm{Ti}(\mathrm{Oi}-\mathrm{Pr})_{4}, t$ - BuOOH , ( - - $-\mathrm{DET}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-40^{\circ} \mathrm{C}$ to $-30^{\circ} \mathrm{C}, 20 \mathrm{~h}, 98 \%$. (iii) $\mathrm{LiAlH}_{4}, \mathrm{Et}_{2} \mathrm{O}$, $0^{\circ} \mathrm{C}, 10 \mathrm{~h}, 80 \%$. (iv) $\mathrm{I}_{2}, \mathrm{NaHCO}_{3}, \mathrm{DBN}, 70 \%$. ## Spencer et al. (1991) ${ }^{14 \mathrm{~d}}$ Scheme 18

Spencer and co-workers employed epoxide $\mathbf{1 0 7}^{33}$ prepared by SAE of nerol. Hydroxyl group protection and reductive opening of epoxide gave 109, which on hydroxyl group protection followed by ozonolysis and reductive work-up afforded 110. Alcohol 110 is converted to olefin 112 via phenyl-selenoxide formation-elimination reaction and deprotection of ethoxy ethyl ether group. The primary hydroxyl group in $\mathbf{1 1 2}$ was oxidized to give the acid $\mathbf{1 1 3}$, which on reductive ozonolysis followed by debenzylation furnished 13.

Scheme 18. Reaction conditions: (i) Ethyl vinyl ether, $p-\mathrm{TsOH}, 0^{\circ} \mathrm{C}-\mathrm{rt}, 1 \mathrm{~h}, 95 \%$. (ii) $\mathrm{LiAlH}_{4}$, $\mathrm{Et}_{2} \mathrm{O}, 0^{\circ} \mathrm{C}-\mathrm{rt}, 16 \mathrm{~h}, 92 \%$. (vi)

PDC, DMF, rt, $36 \mathrm{~h}, 67 \%$. (vii) (a) $\mathrm{O}_{3}, \mathrm{MeOH}: \mathrm{CH}_{2} \mathrm{Cl}_{2}$ (4:1), $-78^{\circ} \mathrm{C}, \mathrm{NaBH}_{4}, 71 \%$, (b) $10 \%$ $\mathrm{Pd} / \mathrm{C}, \mathrm{HCO}_{2} \mathrm{NH}_{4}, \mathrm{MeOH}, 2$ h, reflux, $88 \%$.

## Santaniello et al. (1994) ${ }^{21 b}$ Scheme 19

Santaniello et al. employed Pseudomonas fluorescens lipase (PFL) to resolve racemic 2(3-methyl-2-butenyl)-oxirane methanol 116 to give (-)-epoxyalcohol 117 and (+)-acetate 118 in $\mathbf{9 8 \%}$ ee. The epoxyalcohol on reduction gave the diol 119. The primary hydroxyl is converted into cyanide 120. Hydrolysis of cyanide $\mathbf{1 2 0}$ to acid and reduction produced the alcohol 121. Ozonolysis of 121 followed by reduction of ozonide with polymeric triphenylphosphine furnished lactol 41, which was directly oxidized with PCC to give 13.

Scheme 19. Reaction conditions: (i) DIBAL-H, hexane. (ii) $t$ - $\mathrm{BuOOH}, \mathrm{VO}(\mathrm{acac})_{2}$. (iii) PFL, vinyl acetate, $\mathrm{CHCl}_{3}$. (iv) $\mathrm{LiAlH}_{4}$. (v) (a) $p-\mathrm{TsCl}$, pyridine, (b) $\mathrm{KCN}, \mathrm{EtOH}: \mathrm{H}_{2} \mathrm{O}$, rt. (vi) (a) $\mathrm{NaOH}, 100^{\circ} \mathrm{C}, 8$ h then $\mathrm{H}_{2} \mathrm{SO}_{4}$, (b) $\mathrm{LiAlH}_{4}$. (vii) $\mathrm{O}_{3},\left(\mathrm{PPh}_{3}\right)_{\mathrm{n}}$. (viii) PCC.

## Davis et al. (1995) ${ }^{34}$ Scheme 20

Davis and co-workers used [(8,8-dimethoxycamphoryl)sulfonyl] oxaziridine $\mathbf{1 2 2}$ to achieve asymmetric hydroxylation of the enolate of lactone $\mathbf{1 2 3}$ to give $\mathbf{1 2 4 a}$. Since it proved impossible to isolate 124a from the reaction mixture, the alkoxide was trapped in situ with benzoylchloride to give the crystalline adduct $\mathbf{1 2 4 b}$. Reduction of $\mathbf{1 2 4 b}$ and protection of 1,2-hydroxyl groups as
acetonide 126, followed by protection of the third hydroxyl as benzyl ether gave 127. Deprotection of acetonide and primary hydroxyl conversion into the cyanide afforded $\mathbf{1 2 9 .}$ Hydrolysis of cyanide 129 and subsequent debenzylation furnished $(R)-(-)$-mevalonolactone 13.

(+)-122

Scheme 20. Reaction conditions: (i) $\mathrm{NaHMDS},-78^{\circ} \mathrm{C}$, (+)-122, $\mathrm{PhCOCl}, 70 \%$. (ii) $\mathrm{LiAlH}_{4}$, THF, $\mathscr{}^{\circ} \mathrm{C}-\mathrm{rt}, 5 \mathrm{~h}, 70 \%$. (iii) 2,2-DMP, $p-\mathrm{TsOH}, \mathrm{rt}, 2 \mathrm{~h}, 84 \%$. (iv) $\mathrm{NaH}, \mathrm{TBAI}, \mathrm{BnBr}, 90 \%$. (v) $\mathrm{H}_{2} \mathrm{SO}_{4}, \mathrm{H}_{2} \mathrm{O}, 5 \mathrm{~h}, 93 \%$. (vi) (a) p-TsCl, pyridine, $89 \%$, (b) $\mathrm{KCN}, \mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O}, 0^{\circ} \mathrm{C}$-rt, $8 \mathrm{~h}, 94 \%$. (viii) $\mathrm{Pd} / \mathrm{C}, \mathrm{H}_{2}, \mathrm{THF}, 8-10 \mathrm{~h}, 88 \%$.

## Hager et al. (1996) ${ }^{23}$ Scheme 21

Hager et al. employed chloroperoxidase (CPO) in enantioselective epoxidation of ethyl-3-methyl-3-butenoate $\mathbf{1 3 1}$ to give $\mathbf{1 3 2}$ in $93 \%$ ee. Opening of epoxide $\mathbf{1 3 2}$ with cyanide and reduction of ester afforded 34, which on hydrolysis and subsequent lactonization furnished $\mathbf{1 3}$.

Scheme 21. Reaction conditions: (i) $t$-BuOOH, CPO, 0.01M Sodium citrate, $\mathrm{pH} 5.5,1.5 \mathrm{~h}, 67 \%$. (ii) $\mathrm{KCN}, \mathrm{CF}_{3} \mathrm{CO}_{2} \mathrm{H}, \mathrm{EtOH}, 50^{\circ} \mathrm{C}, 14 \mathrm{~h}, 90 \%$. (iii) $\mathrm{NaBH}_{4}, \mathrm{EtOH}, 16 \mathrm{~h}, 98 \%$. (iv) (a) 2 N NaOH , $100^{\circ} \mathrm{C}, 2 \mathrm{~h}$, (b) $10 \% \mathrm{HCl}, \mathrm{MeOH}, \mathrm{CH}_{3} \mathrm{SO}_{3} \mathrm{H}, \mathrm{THF}, 3 \mathrm{~h}, 81 \%$.

## Kakinuma et al. (1997) ${ }^{16}$ Scheme 22

Kakinuma et al. employed the chirality transcription from chiral template ketone-diacetone-D-glucos-3-ulose 134 in the addition of an enolate of methyl senecioate to give 135 . The crucial step in the synthesis was subsequent epoxidation of $\mathbf{1 3 5}$ using alkaline $\mathrm{H}_{2} \mathrm{O}_{2}$ to give 136. Simultaneous reduction of epoxide and lactone functionalities in 136 afforded the triol 137. Deprotection of isopropylidene groups and subsequent exhaustive oxidation with $\mathrm{NaIO}_{4}$ furnished $(R)-(-)$-mevalonolactone 13.

Scheme 22. Reaction conditions: (i) $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{C}=\mathrm{CHCO}_{2} \mathrm{Me}, \mathrm{LDA}, \mathrm{THF},-78^{\circ} \mathrm{C}, 20 \mathrm{~min}, 31 \%$. (ii) $31 \% \mathrm{H}_{2} \mathrm{O}_{2}, \mathrm{NaOH}, \mathrm{MeOH}, 2.5 \mathrm{~h}, \mathrm{rt}, 87 \%$. (iii) $\mathrm{LiAlH}_{4}$, THF, rt, $1 \mathrm{~h}, 87 \%$. (iv) (a) $\mathrm{CF}_{3} \mathrm{CO}_{2} \mathrm{H}, 2 \mathrm{~h}$, rt, (b) $\mathrm{NaIO}_{4}, \mathrm{H}_{2} \mathrm{O}, 8 \mathrm{~h}, \mathrm{rt}, 47 \%$.

## Ogasawara et al. (1997) ${ }^{35}$ Scheme 23

In Ogasawara's approach, the tricyclic meso-ene-1,4-diol 138 was enantiospecifically desymmetrized in the presence of a lipase to give the enantiomerically pure (+)-monoacetate $\mathbf{1 3 9}$ which on reflux with ammonium formate in the presence of $\mathrm{PdCb}_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ (cat) furnished $\alpha, \beta$ unsaturated ketone 140. Ketone 140 was subjected to $\beta$-methylation procedure ${ }^{36}$ to give $\beta$ methyl enone 143 followed by epoxidation to furnish exo-epoxide 144. Regioselective epoxide cleavage and ketone reduction afforded 1,3-trans-diol 146 by hydride attack from the convex face. Thermolysis of 146 furnished cyclohexendiol 147 by retro-Diels-Alder reaction. Ozonolysis of 147 and reductive work-up followed by cleavage of glycol and cyclization afforded the lactol 41, which was oxidized with Jones reagent to give 13.

Scheme 23. Reaction conditions: (i) Lipase PS, vinyl acetate, THF, rt, 4 d, $85 \%$, $99 \%$ ee. (ii) $\mathrm{HCO}_{2} \mathrm{NH}_{4}, \mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ (cat), MeCN, reflux, $20 \mathrm{~min}, 80 \%$. (iii) $\mathrm{PPh}_{3}, \mathrm{TBSOTf}, \mathrm{THF},-78^{\circ} \mathrm{C}$. (iv) $n$-BuLi, THF, $-78^{\circ} \mathrm{C}$, HCHO (gas). (v) $5 \% \mathrm{HCl}, 78 \%$. (v) $\mathrm{LiAlH}_{4}$, THF, reflux, $1 \mathrm{~h}, 93 \%$. (vi) $\mathrm{Ac}_{2} \mathrm{O}$, DMAP, $95^{\circ} \mathrm{C}, 4 \mathrm{~h}, 100 \%$. (vii) (a) $\mathrm{NaIO}_{4}, \mathrm{RuCl}_{3}$-cat, $\mathrm{CH}_{3} \mathrm{CN}$ -$\mathrm{CCl}_{4}-\mathrm{H}_{2} \mathrm{O}$, (b) aq. $\mathrm{HCl}, 72 \%$. (viii) (a) $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{MeOH}$, reflux, (b) aq. $\mathrm{HCl}, \mathrm{pH} 1,97 \%$.

### 2.2.3. Present Work

## Objective:

Although several syntheses of both (+)- and (-)-mevalonolactone are documented in the literature through varied synthetic routes, most involve a large number of steps or costly chiral auxiliaries and resolving agents. Hence, interest in newer synthetic methods with fewer steps goes unabated.

Since a cyclic sulfate derived from terminal diol could be converted into $\beta$-hydroxy- $\delta$-lactone, we envisaged devising an asymmetric synthesis of $(R)-(-)$-mevalonolactone. The retrosynthetic analysis is shown below (Scheme 25). The $\beta$-hydroxy acid was visualized as an ultimate precursor to the target molecule. The essential feature of our retroanalysis was the regioselective opening of cyclic sulfate with cyanide at the terminal carbon and the chemoselective hydrolysis of the sulfate ester to give the desired $\beta$-hydroxy acid. Deprotection of the C-5 hydroxyl and lactonization would give $(R)$-(-)-mevalonolactone 13.

Scheme 25: Retrosynthetic Analysis

### 2.2.4. Results and Discussion

The detailed synthetic strategy involving the SAD and regioselective opening of cyclic sulfate by cyanide nucleophile as key steps is given in Scheme 26. Commercially available 3-methyl-3-butene-1-ol (157) was protected with ethyl vinyl ether in the presence of catalytic $p$ - TsOH at $0^{\circ} \mathrm{C}$ to give $\mathbf{1 5 8}$ in $93 \%$ yield. The $\mathbb{R}$ spectrum of $\mathbf{1 5 8}$ showed $\mathrm{C}=\mathrm{C}$ stretching at $1648 \mathrm{~cm}^{-1}$ and absence of hydroxyl absorption. In the ${ }^{1} \mathrm{H}$ NMR spectrum the terminal olefin protons gave a doublet at $\delta$ 4.76. The SAD of 158 using ( DHQD$)_{2}$ - PHAL as chiral ligand and $\mathrm{OsO}_{4}$ (cat) gave the diol $\mathbf{1 5 9}$ in $97 \%$ yield. The IR spectrum of $\mathbf{1 5 9}$ showed hydroxyl absorption at $3430 \mathrm{~cm}^{-1}$ and absence of $\mathrm{C}=\mathrm{C}$ stretching. The ${ }^{1} \mathrm{H}$ NMR spectrum showed absence of olefin peaks, while two

Scheme 26. Reaction conditions: (i) Ethyl vinyl ether, p-TsOH (cat), $0^{\circ} \mathrm{C}, 1 \mathrm{~h}, 93 \%$. (ii) (DHQD) $2_{2}$ - $\mathrm{PHAL}, \mathrm{OsO}_{4}$ (cat), $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}, \mathrm{~K}_{2} \mathrm{CO}_{3}, t$ - $\mathrm{BuOH}: \mathrm{H}_{2} \mathrm{O}$ (1:1), $0^{\circ} \mathrm{C}, 24 \mathrm{~h}, 97 \%$. (iii) (a) $\mathrm{SOCl}_{2}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 0^{\circ} \mathrm{C}, 20 \mathrm{~min}$, (b) $\mathrm{RuCl}_{3} \cdot \mathrm{H}_{2} \mathrm{O}, \mathrm{NaIO}_{4}, \mathrm{CCl}_{4}: \mathrm{CH}_{3} \mathrm{CN}: \mathrm{H}_{2} \mathrm{O}(1: 1: 1.5), 0^{\circ} \mathrm{C}, 2 \mathrm{~h}$, $92 \%$. (iv) $\mathrm{NaCN}, \mathrm{DMF}, 80^{\circ} \mathrm{C}, 8 \mathrm{~h}$, then THF, conc. $\mathrm{H}_{2} \mathrm{SO}_{4}: \mathrm{H}_{2} \mathrm{O}$ (2:1), rt, $6 \mathrm{~h}(85 \%)$. (v) 3 N $\mathrm{NaOH}, 70^{\circ} \mathrm{C}, 3 \mathrm{~h}$, then $\mathrm{MeOH}, \mathrm{pH} 2$ (conc. HCl ), acetone, $p$ - TsOH (cat), rt, $8 \mathrm{~h}, 70 \%$. (vi) $\mathrm{NaCN}, \mathrm{DMF}, 80^{\circ} \mathrm{C}, 8 \mathrm{~h}$, then conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$ (2 eq.), $\mathrm{EtOH}: \mathrm{H}_{2} \mathrm{O}$ (1:2), reflux, $18 \mathrm{~h}, 60 \%$. (vii) $p$ TsCl , pyridine, rt, $18 \mathrm{~h}, 96 \%$. (viii) $\mathrm{NaCN}, \mathrm{EtOH}: \mathrm{H}_{2} \mathrm{O}$ (3:2), rt, $18 \mathrm{~h}, 97 \%$.
broad singlets for hydroxyl protons appeared at $\delta 2.17$ and 2.97 . Diol 159 was treated with $\mathrm{SOCl}_{2}$ and $\mathrm{Et}_{3} \mathrm{~N}$ to produce the cyclic sulfite, which was further oxidized using $\mathrm{NaIO}_{4}$ and a catalytic amount of $\mathrm{RuCl}_{3} \cdot \mathrm{H}_{2} \mathrm{O}$ to give the cyclic sulfate 160 in $92 \%$ yield. The IR spectrum of 160 showed the absence of hydroxyl absorption. A downfield shift in the ${ }^{1} \mathrm{H}$ NMR spectrum, of -$\mathrm{CH}_{2}-\mathrm{SO}_{2}-$ protons to $\delta 4.4-4.6$ as multiplet was observed in comparison to the same protons of 159 at $\delta 3.43$ (multiplet). The regioselective opening of cyclic sulfate 160 was presumed to occur at the terminal carbon in a nucleophilic attack. Hence, the cyclic sulfate was treated in DMF solvent with NaCN at $80^{\circ} \mathrm{C}$ followed by chemoselective hydrolysis ${ }^{37}$ of the intermediate sulfate ester under mild conditions using $\mathrm{H}_{2} \mathrm{SO}_{4}$ and minimum water to give the $\beta$-hydroxy cyano compound 161 in $85 \%$ yield. Under these conditions the ethoxy ethyl ether group remained intact. The IR spectrum of $\mathbf{1 6 1}$ showed strong absorption at $3470 \mathrm{~cm}^{-1}$ for hydroxyl group and a weak $\mathrm{C} \equiv \mathrm{N}$ stretching at $2250 \mathrm{~cm}^{-1}$. The $-\mathrm{CH}_{2} \mathrm{CN}$ protons appeared as a doublet at $\delta 2.58$ in the ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{1 6 1}$ and the cyanide carbon appeared at $\delta 117.54$ in the ${ }^{13} \mathrm{C}$ NMR spectrum.

Alternatively, the cyano compound 161 was obtained from diol 159 via monotosylation and tosyl displacement with cyanide. Toward this end, treatment of diol 159 with $p-\mathrm{TsCl}$ and pyridine at room temperature afforded the mono-tosylate $\mathbf{1 6 2}$ in $96 \%$ yield. The ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{1 6 2}$ showed the aryl methyl as a singlet at $\delta 2.45$ and two doublets at $\delta 7.36$ and 7.80 with coupling constant $J=8 \mathrm{~Hz}$ for ortho coupled protons, indicating a tosyl group. The tosylate $\mathbf{1 6 2}$ was treated with NaCN in $\mathrm{EtOH}: \mathrm{H}_{2} \mathrm{O}(3: 2, v / v)$ at $0^{\circ} \mathrm{C}$ to room temperature for 18 h to afford $\mathbf{1 6 1}$ in $\mathbf{9 7 \%}$ yield. All data for $\mathbf{1 6 1}$ prepared via tosyl displacement matched well with the same prepared via cyclic sulfate opening.

The cyano compound 161 was hydrolyzed with aq. 3 N NaOH at $70^{\circ} \mathrm{C}$ to give the corresponding acid which without isolation, was treated with $p-\mathrm{TsOH}$ in acetone to effect both ethoxy ethyl ether deprotection and lactonization to give $(R)$-mevalonolactone $\mathbf{1 3}$ in $\mathbf{7 0 \%}$ yield. The $[\alpha]_{D}{ }^{20}-19.1(\mathrm{c}=0.4, \mathrm{EtOH})$ matched with the literature value of $[\alpha]_{\mathrm{D}}{ }^{20}-21.6(\mathrm{c}=1.565$, $95 \% \mathrm{EtOH})^{15 \mathrm{a}}$ and $[\alpha]_{\mathrm{D}}{ }^{25}-19.0\left(\mathrm{c}=2.15, \mathrm{CHCl}_{3}\right) .{ }^{23}$ The lactone 13 was characterized by IR, ${ }^{1} \mathrm{H}$ NMR and EIMS spectral data. The IR spectrum of $\mathbf{1 3}$ showed strong hydroxyl absorption at $3400 \mathrm{~cm}^{-1}$ and the characteristic carbonyl of $\delta$-lactone at $1732 \mathrm{~cm}^{-1}$. In the ${ }^{1} \mathrm{H}$ NMR spectrum the methyl protons appeared as a singlet at $\delta 1.39$ and the methylene protons $\alpha$ - to carbonyl as two doublets at $\delta 2.5$ and 2.7 with a coupling constant of $J=18 \mathrm{~Hz}$. The hydroxyl proton gave a
broad singlet at $\delta$ 2.6. The $-\mathrm{OCH}_{2}$ - protons gave two multiplets at $\delta 4.36$ and 4.62. The EIMS spectrum of $\mathbf{1 3}$ gave $\left[\mathrm{M}^{+}\right]$peak at $m / z 130$ and other characteristic peaks at $m / z 115,85,71$ and 58. The IR, ${ }^{1} \mathrm{H}$ NMR and EIMS of $\mathbf{1 3}$ are in well accordance with the literature data. ${ }^{24}$

The attempt to achieve the one-pot cyclic sulfate opening with NaCN followed by hydrolysis of sulfate ester and cyano group to the corresponding $\beta$-hydroxy acid with concomitant deprotection of the ethoxy ethyl ether linkage and subsequent lactonization to the target lactone $\mathbf{1 3}$ in strong acid media failed. Thus, when the cyclic sulfate 160 was heated with NaCN in DMF solvent at $80^{\circ} \mathrm{C}$, it gave the intermediate sulfate ester. Removal of solvent and treatment of residual sulfate ester with aq. ethanolic solution of conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$ under reflux gave only the anhydromevalonolactone 43. This indicates that in one-pot reaction, sulfate opening with cyanide is followed by acidic hydrolysis of cyanide to acid with simultaneous hydrolysis of sulfate ester as well as deprotection of ethoxy ethyl ether group to give the lactone 13. However, under strong acidic conditions the anhydromevalonolactone 43 was formed presumably by facile dehydration of the $\beta$-hydroxyl group of $\mathbf{1 3}$ to give the stable $\alpha, \beta$-unsaturated- $\delta$-lactone. Lactone 43 was fully characterized by IR, ${ }^{1} \mathrm{H}$ NMR and EIMS spectral data, which matched well with reported data. ${ }^{38}$ The IR spectrum of $\mathbf{4 3}$ showed carbonyl absorption at $1721 \mathrm{~cm}^{-1}$ and absence of hydroxyl absorption. The ${ }^{1} \mathrm{H}$ NMR spectrum exhibited a singlet at $\delta 1.99$ for the methyl group, two triplets at $\delta 2.33$ and 4.39 for methylene protons and a singlet at $\delta 5.79$ for the olefin proton. The EIMS spectrum gave molecular ion peak at $m / z 112$.

To determine the enantiomeic purity, the diol 159 was converted into triol 163. The enantiomeric excess of $89 \%$ for $\mathbf{1 6 3}$ was estimated by GLC using the chiral column Chirasil-ValD ( $25 \mathrm{~m} \times 0.32 \mathrm{~mm}$ I.D.) at $120^{\circ} \mathrm{C}$ for $5 \mathrm{~min}, 10^{\circ} \mathrm{C} / \mathrm{min}$ to $220^{\circ} \mathrm{C}$ (Figure 2). The enantiomeric purity of $\mathbf{1 6 1}$ was determined by converting it into the (+)-MTPA ${ }^{39}$ ester $\mathbf{1 6 4}$ and ${ }^{1} \mathrm{H}$ NMR analysis. The diastereomeric excess of $89 \%$ was indicated based on the integration of the characteristic methylene resonance $\alpha$ - to the cyano group, doublet in the $\delta 2.59-2.61$ region due to the MTPA ester portion.

Figure 2. Chiral GLC profile for compound 163.

### 2.2.5. Conclusion

In conclusion, a short and high yielding asymmetric synthesis of $(R)$-mevalonolactone has been achieved through the Sharpless asymmetric dihydroxylation and regioselective cyanide opening of cyclic sulfate as the key steps for the first time. ${ }^{40}$ Thus, the results described herein constitute a short and efficient synthesis of natural isomer of mevalonolactone. The unnatural $(+)$-isomer of mevalonolactone could also be synthesized via $\alpha$-dihydroxylation using ( DHQ$)_{2}$ PHAL instead of $(\mathrm{DHQD})_{2}$-PHAL as the chiral ligand. The synthetic strategy can be employed in general to make $\beta$-hydroxy lactones of varied ring size and also the chiral substituted $\beta$ hydroxy acids, ${ }^{41}$ which serve as important synthons for several naturally occurring and bioactive molecules.

### 2.2.6. Experimental

## General information

The solvents were purified and dried by standard procedures before use. Petroleum ether of boiling range $60-80^{\circ} \mathrm{C}$ was used. Optical rotations were measured using sodium D line on JASCO-181 digital polarimeter. Infrared spectra were recorded on ATI MATTSON RS-1 FT-IR spectrometer. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR were recorded on Bruker AC-200 and MSL 300 NMR spectrometers respectively. Mass spectra were obtained with a Finnigan MAT-1020 B-70 eV mass spectrometer. Elemental analyses were carried out on a Carlo Erba CHNS-O analyzer. Enantiomeric excess was determined by ${ }^{1} \mathrm{H}$ NMR spectra and by Chirasil-Val-D gas chromatograph.

## Synthesis of 4-(1-ethoxyethoxy)-2-methyl-1-butene, 158

To a stirred solution of ethyl vinyl ether ( 30 mL ) containing $p-\mathrm{TsOH}(60 \mathrm{mg})$ was added 3 -methyl-3-butene-1-ol $157(8.6 \mathrm{~g}, 100 \mathrm{mmol})$ dropwise at $0^{\circ} \mathrm{C}$. After stirring for 1 h , the reaction mixture was warmed to room temperature and diluted with petroleum ether ( 100 mL ). Filtration through a short pad of neutral alumina and removal of solvent gave a yellowish liquid, which was distilled under vacuo to give $\mathbf{1 5 8}(14.65 \mathrm{~g})$ as a colorless liquid.
Yield: $14.65 \mathrm{~g}, 93 \%$
B.p.: $60^{\circ} \mathrm{C} / 10$ torr

TLC: (silica gel, petroleum ether:EtOAc, 1:1) $R_{f}=0.89$

## Synthesis of 4-(1-ethoxyethoxy)-2-methyl-(2R)-butane-1,2-diol, 159

To a mixture of $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}(4.8 \mathrm{~g}, 14.6 \mathrm{mmol}), \mathrm{K}_{2} \mathrm{CO}_{3}(2.02 \mathrm{~g}, 14.6 \mathrm{mmol})$ and $(\mathrm{DHQD})_{2}{ }^{-}$ PHAL ( $38 \mathrm{mg}, 0.0488 \mathrm{mmol}$ ) in $t-\mathrm{BuOH}-\mathrm{H}_{2} \mathrm{O}(1: 1,30 \mathrm{~mL})$ cooled at $0^{\circ} \mathrm{C}$ was added osmium tetroxide ( $100 \mu \mathrm{~L}, 0.1 \mathrm{M}$ solution in toluene). After stirring for 5 min at $0^{\circ} \mathrm{C}$, the olefin $158(0.75$ $\mathrm{g}, 4.74 \mathrm{mmol}$ ) was added in one portion. The reaction mixture was stirred at $0^{\circ} \mathrm{C}$ for 24 h and then quenched with solid sodium sulfite ( 7 g ). The stirring was continued for an additional 45 min and then the solution was extracted with EtOAc $(3 \times 20 \mathrm{~mL})$. The combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. Silica gel column chromatography of the crude product using petroleum ether:EtOAc (3:2) as eluent gave $\mathbf{1 5 9}(0.884 \mathrm{~g})$ as a colorless liquid.

## Synthesis of 5-(1-ethoxyethoxy) ethyl-5-methyl-(5R)-1,3,2-dioxathiolane-2-dioxide, 160

To a stirred solution of the diol $159(0.3 \mathrm{~g}, 1.56 \mathrm{mmol})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ cooled at $0^{\circ} \mathrm{C}$ were added $\mathrm{Et}_{3} \mathrm{~N}(0.436 \mathrm{~g}, 0.6 \mathrm{~mL}, 4.3 \mathrm{mmol})$ and a solution of $\mathrm{SOCl}_{2}(0.278 \mathrm{~g}, 0.17 \mathrm{~mL}, 2.34$ $\mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ over a period of 10 min . Stirring was continued for 20 min at $0^{\circ} \mathrm{C}$ and
then the solution was quenched by adding water $(5 \mathrm{~mL})$ followed by addition of $\mathrm{CH}_{2} \mathrm{Cl}_{2}(30 \mathrm{~mL})$. The organic layer was separated, washed with cold water $(2 \times 10 \mathrm{~mL})$, brine ( 20 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and filtered through a pad of silica gel. The filtrate was concentrated to give a yellow liquid. To this was added a cold solution of $\mathrm{CCl}_{4}(3 \mathrm{~mL})$ and $\mathrm{CH}_{3} \mathrm{CN}(3 \mathrm{~mL})$. The reaction flask was cooled in an ice bath and cold water ( 4.5 mL ) was added. $\mathrm{RuCl}_{3} . \mathrm{H}_{2} \mathrm{O}(4.5 \mathrm{mg}, 0.021 \mathrm{mmol})$ and $\mathrm{NaIO}_{4}(0.535 \mathrm{~g}, 2.5 \mathrm{mmol})$ were added at once and the reaction mixture was stirred vigorously at $0^{\circ} \mathrm{C}$. The progress of reaction was monitored by TLC. After 2 h , ether ( 20 mL ) was added and the layers separated. The aqueous layer was extracted with ether $(3 \times 10 \mathrm{~mL})$ and the combined organic layers were washed with brine $(20 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and passed through a silica gel column. The filtrate was concentrated and the crude product was purified by silica gel column chromatography using petroleum ether:EtOAc (9:1) as eluent to give $\mathbf{1 6 0}(0.365 \mathrm{~g})$ as a yellow liquid.

Yield: $0.365 \mathrm{~g}, 92 \%$
TLC: (silica gel, petroleum ether:EtOAc, 4:1) $R_{f}=0.51$

## Synthesis of 4-(1-ethoxyethoxy)-2-hydroxy-2-methyl-(2S)-butylcyanide 161

161
To a solution of cyclic sulfate $\mathbf{1 6 0}(0.25 \mathrm{~g}, 0.983 \mathrm{mmol})$ in dry DMF $(8 \mathrm{~mL})$ was added NaCN $(0.08 \mathrm{~g}, 1.63 \mathrm{mmol})$ and stirred under argon for 8 h at $80^{\circ} \mathrm{C}$. The solvent was removed under reduced pressure. The residue was suspended in dry THF ( 5 mL ) and conc. $\mathrm{H}_{2} \mathrm{SO}_{4}(0.05 \mathrm{~mL})$ and water $(0.025 \mathrm{~mL})$ were added to the stirred suspension. The hydrolysis was monitored by TLC.

After 6 h , excess $\mathrm{NaHCO}_{3}$ was added and stirred for 15 min . Filtration through celite and concentration of the filtrate under reduced pressure gave the crude product which was purified by silica gel column chromatography using petroleum ether:EtOAc (3:2) as eluent to give $\mathbf{1 6 1}$ $(0.168 \mathrm{~g})$ as a colorless oil.
Yield: $0.168 \mathrm{~g}, 85 \%$
TLC: (silica gel, EtOAc) $R_{f}=0.825$
$[\alpha]_{\mathbf{D}}{ }^{\mathbf{2 0}}:+1.3(\mathrm{c}=0.8, \mathrm{EtOH})$
IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\text {max }} 3470,2979,2933,2250,1451,1382,1345,1131,1092,1058,950$

## Synthesis of (R)-(-)-Mevalonolactone 13

13
To the cyano compound 161 ( $100 \mathrm{mg}, 0.497 \mathrm{mmol}$ ) was added aqueous solution of NaOH $(3 \mathrm{~N}, 1.2 \mathrm{~mL})$ and the mixture was stirred at $70^{\circ} \mathrm{C}$ for 3 h . The suspension was cooled in an ice bath followed by addition of $\mathrm{MeOH}(4 \mathrm{~mL})$. The solution was acidified to pH 2 with concentrated HCl . MeOH was stripped off and the residue was dissolved in acetone ( 5 mL ). To this was added $p$ - $\mathrm{TsOH}(100 \mathrm{mg})$ and the mixture stirred at room temperature for $8 \mathrm{~h} . \mathrm{Et}_{3} \mathrm{~N}$ was added and the solvent removed under reduced pressure. The residue was purified by silica gel column chromatography using petroleum ether:EtOAc (1:4) as eluent to give $\mathbf{1 3}$ ( 0.045 g ) as a pale yellow oil.
Yield: $0.045 \mathrm{~g}, 70 \%$

## Synthesis of anhydromevalonolactone, 43

To a solution of cyclic sulfate $160(0.225 \mathrm{~g}, 0.885 \mathrm{mmol})$ in dry DMF ( 8 mL ) was added $\mathrm{NaCN}(0.087 \mathrm{~g}, 1.77 \mathrm{mmol})$ and stirred under argon for 8 h at $80^{\circ} \mathrm{C}$. The reaction mixture was cooled to room temperature, washed with brine and extracted with ether $(3 \times 15 \mathrm{~mL})$. The ether layer was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. To this was added an aqueous ethanolic solution of concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}$ [conc. $\mathrm{H}_{2} \mathrm{SO}_{4}(0.1 \mathrm{~mL}, 2$ eq.), $\mathrm{EtOH}(1 \mathrm{~mL})$ and water ( 2 mL )] and refluxed for 18 h . The reaction mixture was cooled, neutralized $\left(\mathrm{NaHCO}_{3}\right)$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times$ $15 \mathrm{~mL})$, dried $\left(\mathrm{NaSO}_{4}\right)$ and concentrated. Purification of the crude product by silica gel column chromatography using petroleum ether:EtOAc (1:1) as eluent gave $43(0.06 \mathrm{~g})$ as a colorless oil.
Yield: $0.06 \mathrm{~g}, 60 \%$
TLC: (silica gel, petroleum ether:EtOAc, 1:1) $R_{f}=0.57$
IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max }$ 2978, 2923, 1721, 1647, 1397, 1267, 1150, 1063, 998

## Synthesis of compound 161 via tosyl displacement

161
To a stirred solution of the tosylate $162(0.35 \mathrm{~g}, 1.01 \mathrm{mmol})$ in $\mathrm{EtOH}: \mathrm{H}_{2} \mathrm{O}(3: 2 \mathrm{v} / \mathrm{v}, 5 \mathrm{~mL})$, cooled at $\vartheta^{\circ} \mathrm{C}$ was added $\mathrm{NaCN}(0.174 \mathrm{~g}, 3.55 \mathrm{mmol})$. The mixture was slowly allowed to warm to room temperature. After stirring for 18 h , it was diluted with water and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$.

The organic layer was washed with brine, water, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. Silica gel column chromatography of the crude product using petroleum ether:EtOAc (7:3) gave 161 $(0.198 \mathrm{~g})$ as a colorless oil.
Yield: $0.198 \mathrm{~g}, 97 \%$
$[\alpha] \underline{\mathbf{D}^{20}} \boldsymbol{i}+1.25(\mathrm{c}=0.7, \mathrm{EtOH})$
The spectroscopic data were in full agreement with the one prepared by the opening of cyclic sulfate 160 via step iv, Scheme 26.

### 2.3. SECTION B

## ENANTIOSELECTIVE SYNTHESIS OF THE LACTONE MOIETY OF HMG-CoA REDUCTASE INHIBITORS: COMPACTIN AND MEVINOLIN

### 2.3.1. Introduction

In 1976, Endo et al. ${ }^{42 \mathrm{a}-\mathrm{c}}$ at the Sankyo Co. and Brown et al. ${ }^{42 \mathrm{~d}}$ at Beecham Pharmaceuticals isolated a potent competitive inhibitor of hydroxymethylglutaryl coenzyme A reductase (HMGCoA reductase) from the metabolites of Penicillium citrinum and Penicillium brevicompactum, respectively. The new compound, shown to have structure 165, was named ML 236B by the Japanese group and 'compactin' by the British workers. In 1980, Alberts et al. ${ }^{43}$ at Merck, Sharp and Dohme, reported the isolation of a relative of compactin from Aspergillus terrus. The Merck compound was named 'mevinolin' and shown to have the absolute stereostructure 166. The identical fungal metabolite was isolated from Monascus rubber and named monacolin K. ${ }^{44}$ The Merck group also discovered that the active forms of compactin and mevinolin are the respective open-chain dihydroxy acids 169 and 170.

$165 \mathrm{R}=\mathrm{H} \quad$ Compactin $166 \mathrm{R}=\mathrm{CH}_{3}$ Mevinolin

$167 \mathrm{R}=\mathrm{H}$
$168 \mathrm{R}=\mathrm{CH}_{3}$

$169 \mathrm{R}=\mathrm{H}$
$170 \mathrm{R}=\mathrm{CH}_{3}$

In humans, more than one-half of total body cholesterol is derived from de novo synthesis. ${ }^{45}$ The rate-limiting step in cholesterol biosynthesis is the reduction of HMG-CoA to mevalonic acid. ${ }^{46}$

Because of their potent inhibitory activity on this key enzyme, there is the attractive possibility that compactin or some related compounds might be useful as hypocholesterolemic agents. Indeed, compactin has been shown to lower serum cholesterol levels in dogs, ${ }^{47}$ cynomolgus monkeys, ${ }^{48}$ and humans. ${ }^{49}$ Compactin also has been used as a tool by biochemists in elegant studies which have provided insight into the mechanism by which mammalian cells regulate HMG-CoA reductase. ${ }^{50}$ More recently the dihydro derivatives of compactin ${ }^{51}$ and mevinolin, ${ }^{52} 167$ and 168 , respectively, have been isolated. The class of compounds, distinguished by a highly functionalized decalin unit and a $\beta$-hydroxy- $\delta$-lactone portion linked by an ethylene bridge, are collectively referred to as mevinic acids.

## Mechanism for HMG-CoA Reductase Inhibition

The inhibition of HMG-CoA reductase by compactin and related compounds is reversible. ${ }^{42 b, 53}$ As can be expected from the structure of their acid forms, the inhibition by these compounds is competitive with respect to $\mathrm{HMG}-\mathrm{CoA}$. The $\mathrm{K}_{\mathrm{i}}$ value for the acid form of compactin, which is determined from the partially purified rat liver enzyme, is $\sim 10^{-9} \mathrm{M}$, while under the same conditions, the $\mathrm{K}_{\mathrm{m}}$ value for HMG-CoA is $10^{-5} \mathrm{M} .{ }^{53}$ Thus, the affinity of HMGCoA reductase for compactin is 10,000 -fold higher than its affinity for the natural substrate HMG-CoA, showing compactin to be a highly potent inhibitor.

Compactin does not affect other enzymes involved in cholesterol biosynthesis. ${ }^{54}$ In addition, almost all studies on compactin with cultured cells and intact animals suggest that reductase is the only enzyme that is inhibited by compactin.

## Structure Activity Relationship at Enzyme Level

Structural similarity between HMG-CoA and compactin-related compounds suggests that the active center of these agents in the inhibition of HMG-CoA reductase is at the $\delta$-lactone moiety of the molecules. This hypothesis is supported by the data that inhibitory activity of compactin is reduced to $1 / 100$ or less by acetylation of the hydroxyl group at either $\mathrm{C}-3^{\prime}$ or $\mathrm{C}-5^{\prime}$ and that $5^{\prime}$ phosphocompactin acid and $5^{\prime}$-phosphomonacolin K acid are $1 / 10$ and $1 / 20$ of compactin and monacolin K in the inhibitory activity, respectively. ${ }^{55}$

Other portions of the compactin molecule also seem to be involved in inhibitory activity (Figure 3). Among them, the $\alpha$-methyl-butyrate ester plays a significant role, since analogues that lack such an ester (ML-236A and monacolin J) are $1 / 25$ in the activity, as compared with their respective counterparts (compactin and monacolin K ).

Figure 3: Compactin (ML-236B) related compounds of microbial origin. Numbers in parentheses represent relative activity to inhibit rat liver HMG-CoA reductase.

The decalin ring of compactin-related compounds is essential to the inhibitory activity. This is shown by the data that HMG is more than $10^{6}$ fold less active than compactin. ${ }^{56}$ Dihydrocompactin, dihydromevinolin, and dihydromonacolin L are comparable in the activity to compactin, monacolin K and monacolin L , respectively. ${ }^{51,52}$

Monacolin K analogs that have a methyl group at C 3 are twice as active as their respective compactin analogs (Figure 3), indicating a contribution of the methyl radical to potency. However, hydroxylation at C-8a, C-3, or C-6 has no significant effect. ${ }^{57,58}$

Since discovery, both compactin and mevinolin have attracted considerable world-wide attention due to their unique structural features and biological activities as inhibitors of HMGCoA reductase which is a major rate limiting enzyme responsible for the reduction of HMG-CoA to mevalonic acid ${ }^{55}$ which is a crucial intermediate in the biosynthesis of cholesterol. Mevinolin, presently marketed under the trade name 'Mevacor' by the Merck group is one of the most clinically useful hypocholesterolemic agents. It is manufactured by the fermentation process. Dihydromevinolin, which exhibits biological activity similar to mevinolin, is produced in small quantities during fermentation; it has, therefore not been developed as a clinical candidate. The lactone moiety of the mevinic acids is essential for the inhibition because in its open form, it closely mimics mevalonic acid. The role of the decalin unit is probably hydrophobic in nature. ${ }^{59}$

171

172

173
The design of the synthetic analogs of mevinic acids ${ }^{60}$ has been governed by two major considerations, namely the requirement for a lactone function 171 and the desirability of having a much simpler array of place of the complex decalin system present in the natural products. The resulting analogs 172 of mevinic acids were generally most active when the R group was arylethyl or ( $E$ )-arylethenyl; ${ }^{61}$ an example being the material $\mathbf{1 7 3}$ which, in its dihydroxy acid form, displays 2.8 times the activity of the natural compactin 165 in HMG-CoA reductase inhibition. ${ }^{62}$ This unique structure-activity relation has aroused the interest of synthetic organic chemists, resulting in an onslaught of activity directed at the stereocontrolled synthesis of lactone $\mathbf{1 7 2}$ with different R substituents. ${ }^{63}$

### 2.3.2. Review of Literature

Along with the interest generated by the biological properties of the mevinic acids, their unique structural features have aroused considerable global attention directed at the synthesis of these challenging targets. Synthetic studies in mevinic acids can be grouped into three primary sections: (1) total synthesis, (2) synthesis of the decalin units, and (3) synthesis of $\beta$-hydroxy- $\delta$ lactone moiety.

The $\beta$-hydroxy- $\delta$-lactone moiety in its open acid form closely mimics mevalonic acid and is of prime importance in inhibition. Hence, several research groups round the world have focused much attention in the synthesis of this $\delta$-lactone portion. ${ }^{60,63}$ Some of the important literature syntheses are given below.

## Danishefsky et al. (1982) ${ }^{64}$ Scheme 27

Danishefsky and co-workers have synthesized the masked pyranone segment $\mathbf{1 7 8}$ for the lactone moiety of compactin. The cyclocondensation of silyloxy diene $\mathbf{1 7 4}$ with benzyloxyacetaldehyde $\mathbf{1 7 5}$ gave adduct 176. Treatment of $\mathbf{1 7 6}$ with methanolic HCl produced a methylglycoside 177 with concomitant ketalization; deketalization with acetone containing a trace of HCl . Stereoselective reduction of ketone 177 gave the racemic synthon 178. By starting with an optically active acetonide of glyceraldehyde rather than with benzyloxyacetaldehyde, the synthesis has been manipulated to provide a $100 \%$ optically active version of $\mathbf{1 7 8} .{ }^{65}$

Scheme 27. Reaction conditions: (i) $\mathrm{ZnCl}, \mathrm{PhH}$, rt, $87 \%$. (ii) (a) $\mathrm{MeOH}, \mathrm{HCl}, 69 \%$, (b) $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CO}, \mathrm{HCl}$. (iii) L-Selectride, $88 \%$.

## Clive et al. (1984) ${ }^{66}$ Scheme 28

Clive and co-workers utilized L-malic acid derivative 179 as a precursor. Sequential benzylation, acetonide deprotection, mono-mesylation and base treatment gave the epoxide $\mathbf{1 8 1}$
that was opened with vinyl magnesium bromide to obtain the hydroxy olefin 182. Treatment of alkoxide of $\mathbf{1 8 2}$ sequentially with $\mathrm{CO}_{2}$ and $\mathrm{I}_{2}$ gave iodocarbonate which on hydrolysis and acetonide formation furnished pure acetal 184. Benzyl coupling of 184 gave adduct 185. Deprotection of acetonide and benzyl and oxidation with Fetizons's reagent afforded 188 in poor yield (20\%). Alternatively, $\mathbf{1 8 6}$ on selective protection of primary alcohol and acetonide formation gave 187. Desilylation, oxidation and subsequent lactonization led to the desired lactone 188 (33\% yield).

Scheme 28. Reaction conditions: (i) (a) NaH , DMF, BnBr , (b) $\mathrm{AcOH}-\mathrm{H}_{2} \mathrm{O}, 50^{\circ} \mathrm{C}, 1 \mathrm{~h}, 86 \%$. (ii) (a) MsCl , pyridine, (b) Triton $\mathrm{B}, 65 \%$. (iii) $\mathrm{H} \mathrm{C}=\mathrm{CHMgBr}, 92 \%$. (iv) $n-\mathrm{BuLi}, \mathrm{CO}_{2}, \mathrm{I}_{2}, 69 \%$. (v) $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CO}$, p-TsOH. (vi) (a) p-MeC ${ }_{6} \mathrm{H}_{4} \mathrm{SO}_{2} \mathrm{CH}_{2} \mathrm{Ph}, \mathrm{KH}, \mathrm{DMF}$, rt, 3 h , (b) $6 \% \mathrm{Na}-\mathrm{Hg}, \mathrm{MeOH}$, $78 \%$. (vii) $\mathrm{Me}_{3} \mathrm{SiI}, 73 \%$ ( $94 \%$ with one recycling of 185). (viii) (a) $t-\mathrm{BuPh}_{2} \mathrm{Si}-\mathrm{Cl}$, (b) $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CO}$, $p$-TsOH. (ix) (a) $n$-Bu4NF, (b) Collins [O], (c) PDC, DMF, (d) $\mathrm{HCl}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 33 \%$ from 186.

## Prasad et al. (1984) ${ }^{67}$ Scheme 29

Prasad and Repic have synthesized the lactone moiety beginning with cis-cyclohexane-1,3,5triol 189. Conversion of $\mathbf{1 8 9}$ to bis silyl ether 190 followed by PCC and Baeyer-Villiger oxidations afforded the lactone 191. Methanolysis and oxidation of the resulting hydroxyl gave the aldehyde 193, which on Wittig coupling and desilylation furnished the unmasked lactone 194.

Scheme 29. Reaction conditions: (i) $t$ - $\mathrm{BuPh}_{2} \mathrm{Si}-\mathrm{Cl}$, imidazole, $\mathrm{DMF}, 40 \%$. (ii) (a) $\mathrm{PCC}, 4 \mathrm{~A}^{\circ}$ molecular sieves, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 3 \mathrm{~h}, 93 \%$, (b) m-CPBA, $\mathrm{NaHCO}_{3}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 18 \mathrm{~h}, 77 \%$. (iii) MeOH , $\mathrm{F}_{3} \mathrm{CCO}_{2} \mathrm{H}$, reflux, 20 min , $95 \%$. (iv) PCC , $4 \mathrm{~A}^{\circ}$ molecular sieves, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 4 \mathrm{~h}$. (v) (a) $\mathrm{PhCH}=\mathrm{PPh}_{3}, \mathrm{THF},-20^{\circ} \mathrm{C}, 3 \mathrm{~h}, 77 \%$, (b) $n$ - $\mathrm{Bu} u_{4} \mathrm{NF}, \mathrm{AcOH}, \mathrm{THF}, 20^{\circ} \mathrm{C}, 18 \mathrm{~h}, 60^{\circ} \mathrm{C}, 2 \mathrm{~h}, 45 \%$.

Guindon et al. (1985) ${ }^{68}$ Scheme 30
In Guidon's approach, the L-malic acid aldehyde 195 was converted into olefin ester 196. Acetonide deprotection and selective silylation of the primary alcohol afforded the mono protected diol 197 that on treatment with catalytic NaOEt , establishes equilibrium with its isomer 198. Ensuing intramolecular Michael reaction displaces the equilibrium and the tetrahydrofurans 199 and 200 are obtained in 2:1 ratio. Cleavage of 199 with dimethylboronbromide proceeds regiospecifically to produce, after protection, the bromide 201. Cleavage of the silyl ether afforded the epoxide 202, which was opened regioselectively to give 203. Subsequent acidcatalyzed cyclization and unmasking of the hydroxyl group gave the lactone 204.

Scheme 30. Reaction conditions: (i) $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{CHCO}_{2} \mathrm{Et}, 84 \%$. (ii) (a) $1 \mathrm{NHCl}, \mathrm{THF}$, (b) $t-\mathrm{BuPh}_{2} \mathrm{Si}-$ $\mathrm{Cl}, \mathrm{Et}_{3} \mathrm{~N}$, DMAP, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, rt. (iii) $10 \mathrm{~mol} \% \mathrm{NaOEt}, \mathrm{EtOH}, 87 \%$. (iv) (a) $\mathrm{Me}_{2} \mathrm{BBr}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 82 \%$, (b) MOMCl, $i-\mathrm{Pr}_{2} \mathrm{NEt}, \mathrm{DMAP}, \mathrm{CH}_{3} \mathrm{CN}, 94 \%$. (v) $n-\mathrm{Bu}_{4} \mathrm{NF}, \mathrm{THF}, 80 \%$. (vi) $\mathrm{R}_{2} \mathrm{CuMgBr}, \mathrm{Et}_{2} \mathrm{O}$, $-78^{\circ} \mathrm{C}$, then $-23^{\circ} \mathrm{C}, 1 \mathrm{~h}, 100 \%$. (vii) (a) $p$ - $\mathrm{TsOH}, \mathrm{PhH}, 90 \%$, (b) $\mathrm{Me}_{2} \mathrm{BBr}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 79 \%$.

## Lynch et al. (1987) ${ }^{69}$ Scheme 31

Lynch and co-workers have utilized the diastereoselective Aldol reaction of $\mathbf{2 0 5}$ with Mg (II) enolate of 206 following the procedure of Braun and Devant ${ }^{70}$ to give the diastereoisomer 207 ( $S S: S R=97: 3$ ). Transesterification of 207 followed by Claisen condensation furnished 209. The 5-( $S$ )-hydroxyl directed reduction of $\beta$-keto ester 209 gave diol 210. Subsequent saponification and acidification afforded the lactone 211.

Scheme 31. Reaction conditions: (i) (a) LDA, THF, (b) $\mathrm{MgBr}_{2}, 93 \%$. (ii) $\mathrm{NaOMe}, \mathrm{MeOH}, 95 \%$. (iii) lithio $t$-butylacetate, THF, $-40^{\circ} \mathrm{C}$ to $-30^{\circ} \mathrm{C}, 90 \%$. (iv) $\mathrm{Et}_{3} \mathrm{~B}, \mathrm{NaBH}_{4}, \mathrm{THF}-\mathrm{MeOH},-78^{\circ} \mathrm{C}$, 93\%. (v) $\mathrm{H}^{+}$, $\mathrm{pH} 3.8,85 \%$.

## Roth et al. (1988) ${ }^{71}$ Scheme 32

Roth and Roark have used the commercially available glucal 212. PCC oxidation of 212 afforded the unsaturated lactone 213. Reductive deconjugation with $\mathrm{Zn}-\mathrm{AcOH}$ followed by reconjugation with $\mathrm{Et}_{3} \mathrm{~N}$ produced the 5-deoxygenated lactone 214. Hydrolysis and tosylation gave 215, which on reaction with sodium allyl alcoholate produced the epoxide 216. Reaction of 216 with dibenzylcuprate followed by allyl deprotection gave the lactone 188.

Scheme 32. Reaction conditions: (i) $\mathrm{PCC}, 85 \%$. (ii) $\mathrm{Zn}-\mathrm{AcOH}$ and then $\mathrm{Et}_{3} \mathrm{~N}, 92 \%$. (iii) (a) 2 N HCl , (b) $p-\mathrm{TsCl}, 92 \%$. (iv) $\mathrm{CH}_{2}=\mathrm{CHCH}_{2} \mathrm{ONa}$, allyl alcohol, $87 \%$. (v) $\mathrm{PhCH}_{2} \mathrm{MgCl}, \mathrm{CuBr}-\mathrm{Me}_{2} \mathrm{~S}$, $73 \%$. (vi) $10 \% \mathrm{Pd} / \mathrm{C}$, dioxane: $\mathrm{H}_{2} \mathrm{O}(2: 1), 50 \%$.

## Takano et al. (1989) ${ }^{72}$ Scheme 33

In Takano's approach, $(R)$ - $O$-benzylglycidol 218 is opened with sodium acetylide to give 219. Silyl protection of the hydroxyl group followed by sequential lithiation and methoxy carbonylation gave ester 221. Alkyne reduction to ( $Z$ )-olefin and exposure to acid furnished the $\alpha, \beta$-unsaturated lactone 223. Epoxidation of 223 stereoselectively gave the epoxide 224. Regioselective cleavage of the oxirane and debenzylation furnished the lactone 226.

Scheme 33. Reaction conditions: (i) NaH , DMSO , acetylene, $87 \%$. (ii) $t$ - $\mathrm{BuMe}_{2} \mathrm{Si}-\mathrm{Cl}$, imidazole, $99 \%$. (iii) (a) $n$ - $\mathrm{BuLi}, \mathrm{THF},-72^{\circ} \mathrm{C}$, (b) $\mathrm{ClCO}_{2} \mathrm{Me},-50^{\circ} \mathrm{C}, 87 \%$. (iv) $\mathrm{H}_{2}$, Lindlar cat. PhH , quinoline, rt, $99 \%$. (v) conc. $\mathrm{HCl}, \mathrm{MeOH}$, rt, $86 \%$. (vi) $30 \% \mathrm{HO}_{2}, 6 \mathrm{~N} \mathrm{NaOH}, \mathrm{MeOH}, \mathrm{rt}, 73 \%$. (vii) $(\mathrm{PhSe})_{2}, \mathrm{NaBH}_{4}, \mathrm{AcOH}, i$ - $\mathrm{PrOH}, \mathrm{rt}, 87 \%$. (viii) $\mathrm{H}_{2}, \mathrm{Pd}(\mathrm{OH})_{2}, \mathrm{EtOAc}, \mathrm{rt}, 81 \%$.

## Jurczak et al. (1990) ${ }^{73}$ Scheme 34

In Jurczak's approach the asymmetric hetero Diels-Alder reaction of 1-methoxybuta-1,3diene 228 with ( $2 R$ )- N -glyoxyloylbornane-10,2-sultam 227 furnished the adduct 229. Reduction of 229 and benzylation of hydroxyl gave 230. Anomeric oxidation ${ }^{74}$ of $\mathbf{2 3 0}$ afforded 223. Compound 223 is transformed into the lactone 226 as shown in Scheme 33.

Scheme 34. Reaction conditions: (i) (a) $2 \mathrm{~mol} \% \mathrm{Eu}(f o d) 3$, (b) PPTS. (ii) (a) $\mathrm{LiAlH}_{4}$, (b) NaH , BnBr . (iii) (a) $30 \% \mathrm{H}_{2} \mathrm{O}_{2}, \mathrm{MoO}_{3}$ (cat), (b) $\mathrm{Ac}_{2} \mathrm{O}$, pyridine. (iv)-(vi) as in Scheme 33.

## Bonini et al. (1991) ${ }^{75}$ Scheme 35

Bonini and co-workers employed biocatalytic lactonization of syn-3,5-dihydroxy esters 235 which were obtained by the diastereoselective reduction of the aldol derived from dianion of acetoacetate with an appropriate aldehyde 234. Biocatalytic lactonization of $\mathbf{2 3 5 a} / \mathbf{b}$ with pig liver esterase (PLE) afforded the unnatural mevinic acid analogs (-)-188 and (-)-236 respectively. However, when porcine pancreatic lipase (PPL) is used to perform lactonization of the dihydroxy esters $\mathbf{2 3 5 a} / \mathbf{b}$, natural analogs of the mevinic acid (+)- $\mathbf{1 8 8}$ and (+)-237 are obtained in good yield and high enantiomeric excess.

Scheme 35. Reaction conditions: (i) (a) $\mathrm{H}_{3} \mathrm{CCOCH}_{2} \mathrm{CO}_{2} \mathrm{Me}, 2 \mathrm{LDA}$, (b) $\mathrm{Ti}(\mathrm{Oi}-\mathrm{Pr})_{4}, \mathrm{NaBH}_{4}$. (ii) PLE, 80\%. (iii) PPL, 70\%.

Mohr et al. (1992) ${ }^{76}$ Scheme 36
Mohr and co-workers employed the $Z$-allyl silane 240 in an epoxidation reaction with $\mathrm{V}^{5+} / t$ BuOOH with high erythro-selectivity to give 241. Subsequent HF or TBAF induced fragmentation afforded syn-1,3-diol 242 which is then transformed into the lactone 243.

Scheme 36. Reaction conditions: (i) Propargyl trimethylsilane, $n$ - BuLi , THF, $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$. (ii) Lindlar catalyst, $\mathrm{H}_{2}$. (iii) $t$ - BuOOH ( 1.5 eq .), $\mathrm{VO}(\mathrm{acac})_{2},-15^{\circ} \mathrm{C}$-rt, 15 h , (iv) $n$ - $\mathrm{Bu}_{4} \mathrm{NF}$, THF, 57\% from 240. (v) camphor sulfonic acid.

## Hiyama et al. ${ }^{77}$ (1993) Scheme 37

Hiyama and co-workers employed stereoselective reductions of a $\beta, \delta$-diketo ester $\mathbf{2 4 6}$ derived from D-tartaric acid to give chiral $\beta, \delta$-syn dihydroxyester 248. Protection of 1,3 -diol as acetonide and removal of silyl groups gave diol 249. Oxidative cleavage of 249 afforded the desired aldehyde 250. Wittig olefination with the carbanion of $\mathrm{Ar}^{\prime} \mathrm{CH}_{2} \mathrm{P}(\mathrm{O}) \mathrm{Ph}_{2}$ gave various types of HMG-CoA reductase inhibitors 251.

Scheme 37. Reaction conditions: (i) $\mathrm{NaH}, n-\mathrm{BuLi},-78^{\circ} \mathrm{C}, 20 \mathrm{~h}, 74 \%$. (ii) DIBAL-H, THF, hexane, $78^{\circ} \mathrm{C}, 4 \mathrm{~h}, 60 \%$. (iii) $\mathrm{Et}_{2} \mathrm{BOMe}, \mathrm{NaBH}_{4}, \mathrm{THF}, \mathrm{MeOH},-78^{\circ} \mathrm{C}$-rt, $12 \mathrm{~h}, 76 \%$. (iv) (a) 2,2DMP, $p-\mathrm{TsOH}, \mathrm{rt}, 2 \mathrm{~h}, 98 \%$, (b) $n$ - $\mathrm{Bu}_{4} \mathrm{NF}$, THF, rt, $3 \mathrm{~h}, 99 \%$. (v) $\mathrm{NaIO}_{4}, \mathrm{Et}_{2} \mathrm{O}, \mathrm{H}_{2} \mathrm{O}, \mathrm{rt}, 2 \mathrm{~h}, 85 \%$. (vi) (a) $\mathrm{Ar}^{\prime} \mathrm{CH}_{2} \mathrm{P}(\mathrm{O}) \mathrm{Ph}_{2}$, lithium 2,2,6,6-tetramethylpiperazide, (b) $\mathrm{CF}_{3} \mathrm{CO}_{2} \mathrm{H}$.

## Dittmer et al. ${ }^{78}$ (1994) Scheme 38

In Dittmer's approach the SAE of allylic alcohol 252 and conversion of hydroxyl into tosylate gave glycidyl sulfonate which on tellurium-induced nucleophilic reduction afforded allylic alcohol 253. Sequential protection of hydroxyl, hydroboration and PCC oxidation gave aldehyde 254. Subsequent Wittig reaction and borohydride reduction furnished the allylic acohol 255. The SAE-Te transposition sequence on $\mathbf{2 5 5}$ gave 256 which spontaneously lactonized to afford 257. Silyl group deprotection gave 243.

Scheme 38. Reaction conditions: (i) (a) $t$ - BuOOH , (+)-DIPT, $\mathrm{Ti}(\mathrm{O} i-\mathrm{Pr})_{4}$, (b) $p-\mathrm{TsCl}, \mathrm{Et}_{3} \mathrm{~N}$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, (c) $\mathrm{Te}^{2-}\left(\mathrm{Te}, \mathrm{NaBH}_{4}, \quad \mathrm{DMF}\right)$. (ii) (a) $t$ - $\mathrm{BuMe}_{2} \mathrm{Si} \mathrm{Cl}$, imidazole, DMF, (b) ( $\left.\mathrm{Me}_{2} \mathrm{CHCHMe}\right)_{2} \mathrm{BH}, \mathrm{THF},-12^{\circ} \mathrm{C}$, (c) $\mathrm{PCC}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 63 \%$ from 253. (iii) (a) $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{CHCHO}$, $\mathrm{PhH}, \mathrm{THF}$, (b) $\mathrm{NaBH}_{4}, \mathrm{MeOH},-50^{\circ} \mathrm{C}, 60 \%$ from 254. (iv) $n$ - $\mathrm{Bu}_{4} \mathrm{NF}$.

## Suemune et al. ${ }^{79}$ (1992) Scheme 39

Suemune and co-workers used porcine liver esterase (PLE) in desymmetrization of $\mathbf{2 5 8}$ to give 259. Subsequent oxidation and stereoselective reduction gave 260. Mitsunobu's inversion of 260 gave the epimeric material 261. Ozonolysis followed by Jones oxidation of 260/261 and subsequent esterification gave 262/263. Solvolysis of $\mathbf{2 6 2} / 263$ and subsequent lactonization afforded the lactone moiety of compactin 264 and its epimer at C-5, 265.

Scheme 39. Reaction conditions: (i) PLE, $\mathrm{pH} 7,62 \%$. (ii) (a) Swern oxidation, $92 \%$, (b) $\mathrm{NaBH}_{4}$, $\mathrm{CeCl}_{3}, \mathrm{MeOH}, 90 \%$. (iii) (a) $\mathrm{Ph}_{3} \mathrm{P}, \mathrm{DEAD}, \mathrm{AcOH}, \mathrm{THF}, 87 \%$, (b) $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{MeOH}, 82 \%$. (iv) (a) $\mathrm{O}_{3}$, (b) Jones oxidation, (c) $\mathrm{CH}_{2} \mathrm{~N}_{2}, 69 \%$. (v) (a) $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{MeOH}, 78 \%$, (b) $p$ - $\mathrm{TsOH}, \mathrm{PhH}, 65 \%$.

Solladie et al. ${ }^{80}$ (1995) Scheme 40
In Solladie's approach, reaction of the trianion of methyl-3,5-dioxahexanoate 266 with (-)menthyl ( $S$ )-p-toluenesulfinate 267 gave the diketosulfoxide 268. DIBAL-H reduction of 268 gave only one diastereomer 269. Reduction of $\delta$-keto group in 269 with $\mathrm{NaBH}_{4}$ and $\mathrm{Et}_{2} \mathrm{BOMe}$ gave the syn-diol 270 in greater than $98 \%$ diastereoselectivity. Protection of 1,3-dihydroxy function, Pummerer reaction, desulfurization and acetate hydrolysis furnished 273. Oxidation of primary alcohol, Wittig olefination and subsequent reduction of olefin gave ester 274. Acetic acid hydrolysis afforded the lactone 188.

Scheme 40. Reaction conditions: (i) $\mathrm{NaH}, t$ - $\mathrm{BuLi}, 0^{\circ} \mathrm{C}$, $68 \%$. (ii) DIBAL-H, THF, 44\%. (iii) $\mathrm{NaBH}_{4}, \mathrm{Et}_{2} \mathrm{BOMe}, 99 \%$. (iv) 2,2-DMP, p-TsOH. (v) Pummerer, $97 \%$. (vi) (a) Raney Ni, $73 \%$, (b) $\mathrm{K}_{2} \mathrm{CO}_{3}, 78 \%$. ## Honda et al. (1997) ${ }^{81}$ Scheme 41

In Honda's approach, the reaction of mono-sodium salt derived from cis,cis-1,3,5-trihydroxy cyclohaxane 275 with 1 equivalent of $t-\mathrm{BuMe}_{2} \mathrm{Si-Cl}$ gave 276, which on further alkylation with BnBr furnished 277. Desilylation, followed by oxidation afforded ketone 278. Enantioselective deprotonation reaction of 278 with lithium $(S, S)$ - $\alpha, \alpha^{\prime}$-dimethyldibenzylamide as the chiral base and TMSCl gave the silyl ether 279. Ozonolysis, aldehyde reduction and esterification of acid furnished 281. Swern oxidation and Wittig reaction led to $1: 4$ mixture of $E: Z$ isomers 282. Benzyl ether deprotection, olefin reduction and lactonization eventually afforded 188.

Scheme 41. Reaction conditions: (i) NaH , pyridine, rt, $t$ - $\mathrm{BuMe}_{2} \mathrm{Si}-\mathrm{Cl}, \mathrm{THF}, 0^{\circ} \mathrm{C}, 84 \%$. ## Suemune et al. (1997) ${ }^{82}$ Scheme 42

Suemune and co-workers desymmetrized meso-1,3-diacetoxy-5-cycloheptene 283 enzymatically using Pseudomonas fluorescence lipase (PFL) to afford the monoacetate 284. Sequential protection of hydroxyl as ethoxy ethyl ether, solvolysis of acetate and protection as TBDPS followed by deprotection of ethoxy ethyl ether gave 286. Reductive ozonolysis of 286 furnished the hemiacetal 287 as a $1: 1$ diastereomeric mixture at the C-2 position. Protection of the hemiacetal function as a TBDMS ether gave the sole product 288 . $\mathrm{NaBH}_{4}$ reduction of 288 and iodination afforded 289, a synthetic equivalent of the lactone moiety in mevinic acids.

Scheme 42. Reaction conditions: (i) PFL, phosphate buffer, $\mathrm{pH} 7,44 \mathrm{~h}, 72 \%$. (ii) Ethyl vinyl ether, PPTS, $79 \%$. ## Kiyooka et al. (1997) ${ }^{85}$ Scheme 44

Kiyooka and coworkers employed the chiral oxazaborolidinone 295 catalyzed Aldol reaction of a silyl ketene involving a dithiolane moiety 294 with 4-phenylbutanal 293 to give 296. Protection of hydroxyl and ester reduction afforded aldehyde 297. A second Aldol reaction on 297 with 294 in the presence of 295 gave syn-1,3-diol 298. Deprotection of TBS group and lactonization furnished the lactone $\mathbf{3 0 0}$.

Scheme 44. Reaction conditions: (i) (a) Nitroethane, $-78^{\circ} \mathrm{C}, 1 \mathrm{~h}, 86 \%$, (b) $\mathrm{Ni}_{2} \mathrm{BH}_{2}, 96 \%$. (ii) (a) TBSCl, (b) DIBAL-H, $85 \%$. (iii) (a) Nitroethane, 294, 295, $-78^{\circ} \mathrm{C}, 1 \mathrm{~h}$, (b) $\mathrm{Ni}_{2} \mathrm{BH}_{2}, 77 \%$. (iv) $n$ $\mathrm{Bu}_{4} \mathrm{NF}$. (v) $p$-TsOH, 70\%.

## Dujardin et al. (1998) ${ }^{86}$ Scheme 45

Dujardin and co-workers employed a hetero Diels-Alder reaction of oxabutadiene 301 with enolether $\mathbf{3 0 2}$ in the presence of $\mathrm{Eu}(\mathrm{fod})_{3}$ to give the endo-heterocycloadduct $\mathbf{3 0 3}$ in $96 \%$ de. Catalytic hydrogenation of $\mathbf{3 0 3}$ and reduction of ester groups followed by benzylation gave $\mathbf{3 0 5}$. Subsequent acidic hydrolysis and PCC oxidation afforded 306. Hydrolysis of lactone and Mitsunobu inversion at C-5 center followed by tert-butyl deprotection furnished lactone $\mathbf{2 2 5}$.

Scheme 45. Reaction conditions: (i) $5 \% \mathrm{Eu}\left(\mathrm{fod}_{3}{ }_{3}\right.$, hexane, reflux, $70 \%$. (ii) $\mathrm{H}_{2} / \mathrm{Pd}-\mathrm{C}, \mathrm{EtOH}, 88 \%$. (iv) (a) $3 \mathrm{~N} \mathrm{HCl}, \mathrm{THF}, 96 \%$, (b) PCC, $3 \mathrm{~A}^{\circ}$ molecular sieves, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 89 \%$. (v) (a) NaOH , THF, (b) $\mathrm{NH}_{4} \mathrm{Cl}$, (c) DIAD, $\mathrm{Ph}_{3} \mathrm{P}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, $42 \%$. (vi) $\mathrm{CF}_{3} \mathrm{CO}_{2} \mathrm{H}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 72 \%$.

## Bouzbouz et al. (2000) ${ }^{87}$ Scheme 46

Bouzbouz and Cossy employed two consecutive enantioselective allytitanation with cyclopentadienyldial-ketoxyallytitanium complex $(R, R)$-308, first on 293 to give 309 and second on aldehyde $\mathbf{3 1 0}$ to give the syn 1,3-diol $\mathbf{3 1 1}$ in $95 \%$ diastereoselectivity. 1,3-Hydroxyl groups protection of $\mathbf{3 1 1}$ and $\mathrm{RuCl}_{3}$ oxidation followed by acid treatment furnished the lactone $\mathbf{1 8 8}$.

Scheme 46. Reaction conditions: (i) $-78^{\circ} \mathrm{C}, 4 \mathrm{~h}, \amalg \mathrm{O}, 12 \mathrm{~h}, 90 \%$. (ii) $\mathrm{OsO}_{4}, \mathrm{NaIO}_{4}, \mathrm{Et}_{2} \mathrm{O}: \mathrm{H}_{2} \mathrm{O}$, $90 \%$. (iii) $(R, R)-308,-78^{\circ} \mathrm{C}, 4 \mathrm{~h}, \mathrm{H}_{2} \mathrm{O}, 12 \mathrm{~h}, 80 \%$. (iv) 2,2 -DMP, $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CO}, \mathrm{CSA}, 0^{\circ} \mathrm{C}, 94 \%$. (v) $\mathrm{RuCl}_{3} .3 \mathrm{H}_{2} \mathrm{O}, \mathrm{AcOH}, \mathrm{THF}, 48 \%$.

## Ghosh et al. (2000) ${ }^{88}$ Scheme 47

Ghosh and Lei carried out enzymatic acylation of racemic alcohol $( \pm)$ - $\mathbf{3 1 3}$ with immobilized lipase PS-30 in presence of isopropenyl acetate to afford optically active ent-313 and the acylated alcohol 314. Compound 314 was converted to ent-313 through saponification and Mitsunobu inversion. Reaction of ent-313 with acryloyl chloride gave acrylate ester 315. Olefin metathesis of $\mathbf{3 1 5}$ with Grubbs catalyst in the presence of $\mathrm{Ti}(\mathrm{O} i-\operatorname{Pr})_{4}$ furnished the $\alpha, \beta$ -unsaturated- $\delta$-lactone 223. Sequential epoxidation, reductive opening of epoxide and debenzylation produced the mevinic acid lactone 226.

Scheme 47. Reaction conditions: (i) Immobilized lipase PS-30, $\mathrm{CH}_{2}=\mathrm{C}(\mathrm{Me}) \mathrm{OAc}$, DME, $37^{\circ} \mathrm{C}$, 36 h . (ii) (a) $\mathrm{LiOH}, \mathrm{THF}-\mathrm{H}_{2} \mathrm{O}, 23^{\circ} \mathrm{C}, 12 \mathrm{~h}$, (b) $p-\mathrm{NO}_{2} \mathrm{PhCO}_{2} \mathrm{H}, \mathrm{Ph}_{3} \mathrm{P}, \mathrm{DEAD}, 23^{\circ} \mathrm{C}, 12 \mathrm{~h}, 91 \%$, (c) $\mathrm{LiOH}, \mathrm{THF}-\mathrm{H}_{2} \mathrm{O}$. ## Uang et al. (2002) ${ }^{90}$ Scheme 49

Uang and co-workers employed the $\mathrm{SmI}_{2}$ mediated intramolecular Reformatsky reaction in the synthesis of the lactone moiety of compactin. Vinyl magnesium bromide reaction on the glycidyl ether 218 furnished 325. Reaction of 325 with bromoacetyl bromide gave 326. Ozonolysis of 326 furnished the aldehyde 327 which on intramolecular Reformatsky reaction mediated by $\mathrm{SmI}_{2}$ afforded the lactone 226 in $>95: 5$ ratio.

Scheme 49. Reaction conditions: (i) $\mathrm{CH}_{2}=\mathrm{CH}-\mathrm{MgBr}, \mathrm{CuCN},-10^{\circ} \mathrm{C}, 94 \%$. (ii) $\mathrm{BrCOCH}_{2} \mathrm{Br}, 2,6-$ lutidine, $0^{\circ} \mathrm{C}, 89 \%$. (iii) $\mathrm{O}_{3}, \mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}, \mathrm{DMS}$. (iv) $\mathrm{SmI}_{2}, \mathrm{THF}, 0^{\circ} \mathrm{C}, 2 \mathrm{~h}, 91 \%$ from 326.

### 2.3.3. Present Work

## Objective:

Efforts directed towards the synthesis of a key synthon representing the lactone portion $\mathbf{1 7 2}$ of mevinic acids with requisite C-4 and C-6 stereochemistry and a suitable linker group at the C-6 position for coupling with the lower decalin core continue unabated. Most of the reports described earlier have used chiral precursors, chiral auxiliaries or are limited in their flexibility of structural modification. Many involve a large number of steps or costly chiral materials and chiral auxiliaries. Hence, a practical route for the construction of the key synthon for mevinic acid lactone portion is still desirable. With the completion of the synthesis of $(R)$-(-)mevalonolactone employing Sharpless asymmetric dihydroxylation and regioselective cyanide opening of chiral cyclic sulfate Synthetic strategy-1) we planned to develop a new synthesis of the lactone portion of mevinic acids. Here we employed the Synthetic strategy-2, wherein the chiral cyclic sulfite derived from $\alpha, \beta$-dihydroxy ester is opened regioselectively at $\alpha$-carbon to give the $\beta$-hydroxy acid precursor, which on hydrolysis and lactonization gave the $\beta$-hydroxy- $\delta$ lactone portion of compactin and mevinolin.

The retrosynthetic analysis for the asymmetric synthesis of lactone 226 is shown in Scheme 50. The left half of the lactone 226 is represented by the fragment 329 , which could be derived from ( $S$ )-(-)-malic acid. The right half is a $\beta$-hydroxy acid synthon 328. In the asymmetric synthesis of $(R)-(-)$-mevalonolactone we have shown that $\beta$-hydroxy acid is obtained by regioselective cyanide opening of cyclic sulfate derived from terminal 1,2-diol. Herein 328 could be obtained by regioselective hydride opening of internal cyclic sulfite 330. A common equivalent for both 329 and 330 is $\mathbf{3 3 1}$. The cyclic sulfite 331 could be derived from olefin 196, through asymmetric dihydroxylation and conversion of diol into cyclic sulfite. Olefin 196 could be obtained by Wittig reaction of stable phosphorane 332 with aldehyde 195 which in turn could be derived from 329. Regioselective opening of cyclic sulfite 331 with hydride nucleophile followed by acidic hydrolysis of sulfite ester will also result in acetonide deprotection and subsequent lactonization to give the lactone 226. Thus, the hydroxyl center in ( $S$ )-malic acid becomes the C-6 chiral center, while regiospecific hydride opening of cyclic sulfite generates the C-4 hydroxyl, which is the key step in the synthesis.

Scheme 50. Retrosynthetic analysis.

### 2.3.4. Results and Discussion

The detailed synthetic route with reaction conditions is given in Scheme 51. (S)-malic acid 333 was esterified with $5 \% \mathrm{HCl}$ in MeOH at room temperature to furnish the diester $\mathbf{3 3 4}$ in $89 \%$ yield as a colorless liquid. The ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{3 3 4}$ showed two singlets for the two methoxy groups at $\delta 3.69$ and 3.79 indicating formation of diester. The reduction of diester with lithium aluminium hydride gave the triol $\mathbf{3 3 5}$ as a thick syrupy liquid in $83 \%$ yield. The $\mathbb{R}$ spectrum of 335 showed the absence of ester carbonyl. The protection of 1,2-dihydroxy with 2,2dimethoxy propane gave the acetonide alcohol 179 in $88 \%$ yield as colorless oil. The minor 1,3acetonide ( $5-10 \%$ ) formed was not separated. The ${ }^{1} \mathrm{H}$ NMR spectrum of 179 showed acetonide methyls at $\delta 1.34$ and 1.40 as singlets. ${ }^{91}$ In the ${ }^{13} \mathrm{C}$ NMR spectrum, acetonide carbons appeared at $\delta 24.91,26.09$ (for two methyl) and $\delta 107.84$ for tertiary carbon. Oxidation of primary hydroxyl group in 179 under normal Swern oxidation conditions gave the corresponding aldehyde $\delta 9.78$, singlet in ${ }^{1} \mathrm{H}$ NMR spectrum) which on subsequent Wittig reaction with (ethoxycarbonylmethylene)triphenylphosphorane gave the trans-olefin 196 in $83 \%$ yield. The IR spectrum of 196 gave a strong peak at $1713 \mathrm{~cm}^{-1}$ for ester carbonyl and a peak at $1650 \mathrm{~cm}^{-1}$ for olefinic bond. In the ${ }^{1} \mathrm{H}$ NMR spectrum of 196, the olefinic peaks appeared at $\delta 5.85$ (doublet of triplet) and $\delta 6.9$ (doublet of triplet) with a coupling constant of $J=16 \mathrm{~Hz}$ indicating trans-
olefin. The $[\alpha]_{D}{ }^{20}-17.9(c=1, \mathrm{MeOH})$ matched well with that reported in the literature $[\alpha]_{D}{ }^{20}-$ $18.0(\mathrm{c}=2.48, \mathrm{MeOH}) .{ }^{68}$

Scheme 51. Reaction conditions: (i) $5 \%$ HCFMeOH, rt, $24 \mathrm{~h}, 89 \%$. (ii) $\mathrm{LiAlH}_{4}$, THF, reflux, 12 h, $83 \%$. (iii) 2,2-DMP, acetone, $p$ - TsOH , rt, $48 \mathrm{~h}, 88 \%$. (iv) (a) $\mathrm{DMSO},(\mathrm{COCl})_{2}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, $-78^{\circ} \mathrm{C}$, (b) $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{CHCO}_{2} \mathrm{Et}$, THF, rt, $24 \mathrm{~h}, 83 \%$. (v) (DHQD) $)_{2}$-PHAL, $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}, \mathrm{~K}_{2} \mathrm{CO}_{3}, \mathrm{OsO}_{4}$ (cat), $\mathrm{MeSO}_{2} \mathrm{NH}_{2}, t$ - $\mathrm{BuOH}: \mathrm{H}_{2} \mathrm{O}(1: 1), 0^{\circ} \mathrm{C}, 24 \mathrm{~h}, 84 \%$. (vi) $\mathrm{SOCl}_{2}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 0^{\circ} \mathrm{C}, 30 \mathrm{~min}$, $90 \%$. (vii) $\mathrm{NaBH}_{4}$, THF, 12 h , rt, then $4 \mathrm{NH}_{2} \mathrm{SO}_{4}, \mathrm{MeOH}$, overnight, $63 \%$.

The Sharpless asymmetric dihydroxylation of olefin 196 using the (DHQD) $)_{2}$-PHAL as chiral ligand and catalytic $\mathrm{OsO}_{4}$ gave the diol 336 in $84 \%$ yield and $94 \%$ de. The IR spectrum of 336 showed hydroxyl absorption at $3436 \mathrm{~cm}^{-1}$. In the ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{3 3 6}$, the olefinic protons disappeared. In the ${ }^{13} \mathrm{C}$ NMR spectrum, the hydroxyl carbons appeared at $\delta 70.25$ and 76.1. Treatment of diol 336 with thionyl chloride and $\mathrm{Et}_{3} \mathrm{~N}$ gave the cyclic sulfite 337 in $90 \%$ yield. The hydroxyl absorption disappeared in the IR spectrum of 337. A downfeld shift of CH-OSprotons was found at $\delta 4.9$ (multiplet) and 5.28 (doublet) in comparison to the same protons of dihydroxy compound 336. With the cyclic sulfite in hand we proceeded to the regioselective
opening at $\alpha$-carbon of the ester group. Opening of cyclic sulfite with hydride would give the intermediate sulfite ester $\mathbf{3 3 8}$ requiring acidic hydrolysis to free the hydroxyl group. Since the next two conversions involve acidic deprotection of acetonide and lactonization we carried out a one pot sequence of reactions involving a regioselective opening of cyclic sulfite, acidic hydrolysis of sulfite ester with simultaneous deprotection and lactonization. Toward this end, treatment of cyclic sulfite $\mathbf{3 3 7}$ with one equivalent of $\mathrm{NaBH}_{4}$ gave the intermediate sulfite ester 338, which without isolation was acidified with aq. $4 \mathrm{~N} \mathrm{H}_{2} \mathrm{SO}_{4}$ in MeOH to give the lactone 226 in the one pot reaction in $63 \%$ yield. The lactone 226 had $[\alpha]_{\mathrm{D}}{ }^{20}=+1.89(\mathrm{c}=0.5, \mathrm{MeOH})$, which matched well with literature value of $[\alpha]_{\mathrm{D}}{ }^{29}+1.81(\mathrm{c}=0.992, \mathrm{MeOH}){ }^{72}$ The IR spectrum of 226 showed hydroxyl absorption at $3477 \mathrm{~cm}^{-1}$ and carbonyl of $\delta$-lactone at $1735 \mathrm{~cm}^{-1}$. The ${ }^{1} \mathrm{H}$ NMR spectrum and EIMS data matched well with that reported in the literature. ${ }^{72}$

To determine the diastereomeric purity, the diol 336 was converted into dibenzoate with benzoyl chloride and pyridine. The diastereomeric purity of dibenzoate was estimated to be in excess of $94 \%$ by HPLC using Lichrocart $250-4$ ( 4 mm ID $\times 25 \mathrm{~cm}$ ) HPLC-Cartridge (R.R.-Whelk-01), $10 \% i$ - PrOH in hexane and also by ${ }^{1} \mathrm{H}$ NMR.

### 2.3.5. Conclusion

The Sharpless asymmetric dihydroxylation of $\alpha, \beta$-unsaturated olefin 196 gave the diol 336 in high diastereoselectivity. The corresponding cyclic sulfite opening occurred regioselectively at the $\alpha$-carbon giving the $\beta$-hydroxy acid which lactonized to $\mathbf{2 2 6}$, representing the lactone portion of mevinic acid. Thus, a short, high yielding and efficient asymmetric synthesis of the lactone moiety of mevinic acids with desired stereochemistry at C-4 and C-6 has been achieved. The presence of hydroxylmethylene functionality at C-6 serves for easy coupling to the lower functionalized core of mevinic acids. The synthetic strategy could also be extended to the synthesis of all possible isomers of the lactone moiety either by using the unnatural $(R)$-(+)-malic acid and/or employing the $(\mathrm{DHQ})_{2}$-PHAL ligand in asymmetric dihydroxylation.

### 2.3.6. Experimental Section

## General information

The solvents were purified and dried by standard procedures before use. Petroleum ether of boiling range $60-80^{\circ} \mathrm{C}$ was used. Optical rotations were measured using sodium D line on JASCO-181 digital polarimeter. Infrared spectra were recorded on ATI MATTSON RS-1 FT-IR spectrometer. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR were recorded on Bruker AC-200 NMR and MSL 300 NMR spectrometers. Mass spectra were obtained with a Finnigan MAT-1020 B-70 eV mass spectrometer. Elemental analyses were carried out on a Carlo Erba CHNS-O analyzer

## Preparation of (S)-dimethylmalate, 334

334
( $S$ )-malic acid $333(20 \mathrm{~g}, 149.15 \mathrm{mmol})$ was dissolved in $5 \% \mathrm{HCl}$ in $\mathrm{MeOH}(120 \mathrm{~mL})$ and stirred at room temperature for 24 h . The reaction mixture was concentrated and distilled (bath temp. $145-150^{\circ} \mathrm{C} / 10 \mathrm{~mm}$ ) to give ( $S$ ) -dimethyl malate ( 17 g ) as a colorless liquid. The residual material in the distillation flask was dissolved in $5 \% \mathrm{HCl}$ in $\mathrm{MeOH}(60 \mathrm{~mL})$ and processed as above. Distillation afforded additional 4.52 g of the diester, raising the total yield to 21.52 g .
Yield: $21.52 \mathrm{~g}, 89 \%$.

Preparation of (S)-1,2,4-butane triol, 335

To a stirred suspension of $\mathrm{LiAlH}_{4}(4.92 \mathrm{~g}, 129.5 \mathrm{mmol})$ in dry THF $(150 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added a solution of $\mathbf{3 3 4}(10 \mathrm{~g}, 61.67 \mathrm{mmol})$ in dry THF $(20 \mathrm{~mL})$. The ice bath was removed and
the reaction mixture was refluxed for 12 h . Excess $\mathrm{LiAlH}_{4}$ was destroyed by adding water ( 50 $\mathrm{mL})$. The white precipitate obtained was filtered and washed with $\mathrm{MeOH}(5 \times 100 \mathrm{~mL})$. The combined filtrate was concentrated to near dryness. The inorganic materials contained in the residual oil were removed by short column chromatography over 50 g of silica gel. Elution with $\mathrm{CHCl}_{3}: \mathrm{EtOH}(550 \mathrm{~mL}, 3: 1 \mathrm{v} / \mathrm{v}$ and $650 \mathrm{~mL}, 2: 1 \mathrm{v} / \mathrm{v}$ ) and concentration of the solvents gave $(S)$ -1,2,4-butanetriol $335(5.45 \mathrm{~g})$ as a syrupy liquid.
Yield: $5.45 \mathrm{~g}, 83 \%$
$[\alpha]_{\underline{D}}^{20}:-28.2(c=1, \mathrm{MeOH})\left[\right.$ lit. $[\alpha]_{\mathrm{D}}{ }^{25}-28(\mathrm{c}=1.07, \mathrm{MeOH})^{91}$ lit. $[\alpha]_{\mathrm{D}}{ }^{25}-29(\mathrm{c}=1.03$, $\mathrm{MeOH})^{92 \mathrm{~b}}$ ]
IR (neat, $\mathbf{c m}^{\mathbf{- 1}}$ ): $\nu_{\max } 3389,3339,2936,2883,1414,1052$

## Synthesis of 2-[(4S)-2,2-dimethyl-1,3-dioxolan-4-yl]ethanol, 179

To a solution of $(S)$-1,2,4-butanetriol $335(5 \mathrm{~g}, 47.11 \mathrm{mmol})$ in dry acetone ( 250 mL ) was added 2,2-dimethoxy propane ( $7.53 \mathrm{~mL}, 61.24 \mathrm{mmol}$ ) and $p$ - $\mathrm{TsOH}(300 \mathrm{mg})$. The reaction mixture was stirred at room temperature for 48 h . A pinch of $\mathrm{NaHCO}_{3}$ was added and stirred for 15 min . The reaction mixture was passed through a pad of silica gel. The filtrate was concentrated and distilled (bath temp. $120-125^{\circ} \mathrm{C} / 10 \mathrm{~mm}$ ) to give ( $S$ ) - 1,2,4-butanetriol 1,2acetonide $\mathbf{1 7 9}(6.15 \mathrm{~g})$ as a colorless liquid.
Yield: $6.15 \mathrm{~g}, 88 \%$
$[\alpha]_{D^{20}}{ }^{\mathbf{2 0}}-3.89(\mathrm{c}=1, \mathrm{MeOH})\left[\right.$ lit. $\left.[\alpha]_{\mathrm{D}}{ }^{20}-2.23(\mathrm{c}=9.8, \mathrm{MeOH})^{93}\right]$

## Synthesis of ethyl (2E)-4-[(4S)-2,2-dimethyl-1,3-dioxolan-4yl]but-2-enoate, 196

To a solution of oxalyl chloride ( $4.36 \mathrm{~g}, 3 \mathrm{~mL}, 34.34 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(80 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$ was added dropwise dry DMSO ( $5.37 \mathrm{~g}, 4.9 \mathrm{~mL}, 68.70 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 20 mL ). After 20 min , 179 ( $3.35 \mathrm{~g}, 22.9 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$ was added dropwise over 30 min giving a copious white precipitate. After stirring for 1 h at $-60^{\circ} \mathrm{C}, \mathrm{Et}_{3} \mathrm{~N}(14.4 \mathrm{~mL}, 103.02 \mathrm{mmol})$ was added slowly and stirred for 1 h allowing the reaction mixture to warm to room temperature. The reaction mixture was poured into $2 \mathrm{~N} \mathrm{HCl}(100 \mathrm{~mL})$ and the organic layer was separated. The aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 50 \mathrm{~mL})$. The combined organic layers were washed with saturated aqueous $\mathrm{NaHCO}_{3}(50 \mathrm{~mL})$, brine $(50 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and passed through a short pad of silica gel. The filtrate was concentrated to give the aldehyde ( 3.1 g ) as pale yellow oil. This was used for the next step without further purification.

IR (neat, $\mathbf{c m}^{\mathbf{- 1}}$ ): $v_{\max } 3035,2957,2805,1717,1631,1374,950$

## CHAPTER 3

## ASYMMETRIC SYNTHESIS OF VICINAL AMINO ALCOHOLS: DIHYDROSPHINGOSINE AND PHYTOSPHINGOSINES

### 3.1. Introduction

The vicinal amino alcohol moiety is a common structural component in a vast array of naturally occurring and synthetic molecules. The common name for this group varies from vicinal amino alcohol to $\beta$-amino alcohol to 1,2 -amino alcohol. Either the amine or the alcohol can be acylated, alkylated or contained within rings. The presence of this moiety and the relative (as well as absolute) stereochemistry are generally important for the biological activity of molecules containing a vicinal amino alcohol. As such, a variety of stereoselective synthetic methods have been developed leading to vicinal amino alcohols.

There are three general groups of vicinal amino alcohols reported in the literature:
(1) Naturally occurring molecules
(2) Synthetic pharmacologically active molecules
(3) Catalysts containing vicinal amino alcohols

## Naturally occurring molecules

Hydroxy amino acids are one of the most common naturally occurring molecules that contain the amino alcohol moiety. Serine and threonine are useful members of the chiral pool. ${ }^{1}$ Other well known examples include bestatin 1, ${ }^{2}$ statine $2,{ }^{3}$ hydroxy ethylene dipeptide isostere $\mathbf{3}^{4}$ and hapalosin $4^{5}$ (Figure 1).

Statine 2 Hydroxy ethylene isostere 3

Hapalosin 4

Figure 1.

Lipids and lipid-like molecules make up a large class of naturally occurring molecules containing the vicinal amino alcohol moiety. Possibly, sphingosine 5, ${ }^{6}$ is the most synthesized amino alcohol. Sphinganine $\mathbf{6},{ }^{7}$ phytosphingosine $7,{ }^{7}$ sulfobacin $\mathrm{B} \mathbf{8}^{8}$ and myriocin $\mathbf{9}^{9}$ are related vicinal amino alcohols (Figure 2).

Figure 2
Cyclic amino alcohols constitute another larger class in which the amine N is contained within a ring. Penaresidin A 10, ${ }^{10}$ anisomysin 11, ${ }^{11}$ preussin $\mathbf{1 2},{ }^{12}$ febrifugine $\mathbf{1 3}^{13}$ and swainsonine $14{ }^{14}$ (Figure 3) are well known examples.

Figure 3
Sugars are yet another class, containing the amino alcohol moiety as components of larger molecules, either aglycones or other sugars. Daunomycin 15, ${ }^{15}$ elsamicin A 16 ${ }^{16}$ and neomycin B $17^{17}$ are important examples (Figure 4).

Daunomycin 15

Elsamicin A 16

Neomycin B 17

Figure 4
Miscellaneous examples like cytoxazone $\mathbf{1 8}^{18}$ contain the amino alcohol moiety as oxazolidinone ring and balanol $19{ }^{19}$ contains acylated amino and alcohol groups (Figure 5).

Cytoxazone 18

Figure 5

A variety of compounds containing the vicinal amino alcohol moiety have been isolated from natural sources. These compounds have a wide range of biological activities. It is the intriguing biological activity as well as the structural complexity of these molecules that have picked the interest of synthetic chemists and fueled extensive efforts to develop methods for the synthesis of vicinal amino alcohols.

## Synthetic pharmacologically active molecules

A host of synthetic molecules used as drugs or pharmacological agents also contain the vicinal amino alcohol moiety. Often these compounds are analogs of natural products containing a vicinal amino alcohol. Saquinavir $\mathbf{2 0}^{20}$ is an HIV protease inhibitor. Recently, the amino alcohol $\mathbf{2 1}^{21}$ has been reported to selectively interact with RNA and has also been investigated as an anti-HIV agent. The amidine-containing molecule $\mathbf{2 2}^{22}$ is reported to be an inhibitor of nitric oxide synthetase (NOS) (Figure 6).

Saquinavir 20

21

22

Figure 6
The presence of the vicinal amino alcohol moiety in these pharmacologically active molecules is essential for their biological activity. The need to prepare these compounds as well as analogs has dramatically increased the importance of the development of methods for the synthesis of vicinal amino alcohols.

## Ligands and Chiral auxiliaries

A number of chiral reagents utilize enantiomerically pure amino alcohols as ligands or chiral auxiliaries. ${ }^{23}$ The best known are the Evans auxiliaries 23, ${ }^{24}$ the oxaborolidines $24{ }^{25}$ and the ephedrine derivatives $\mathbf{2 5}^{26}$ (Figure 7). Most of the amino alcohols used as ligands or chiral auxiliaries are derived from natural sources such as amino acids. The amino acids are generally modified to improve their chelating ability or enhance their blocking effects.

Evans auxiliaries 23

Proline based 24

Ephedrine based 25

Figure 7
From the listing above, it becomes quite obvious why synthetic organic chemists have devoted significant efforts to the development of methods for the synthesis of vicinal amino alcohols. This listing is by no means comprehensive, and many more examples exist in the literature. Nonetheless it does show the breadth and scope of molecular architectures that contain the vicinal amino alcohol moiety.

## Synthetic routes to vicinal amino alcohols

Just as there are many examples of molecules containing the vicinal amino alcohol moiety, there are an equally large number of synthetic routes to these molecules. It is rather difficult to list every method, but several examples can be typified in the main disconnections used to prepare vicinal amino alcohols. Conceptually one can divide these syntheses into four different classes. (1) Functional group manipulation of a molecule containing both heteroatoms; (2) Addition of one heteroatom to a molecule which already contains the other; (3) Addition of both heteroatoms to a molecule which has neither; (4) Coupling of two molecules, each of which has one heteroatom.

## Functional group manipulation

There are two general versions of this disconnection. One involves reduction or nucleophilic addition to an imine or carbonyl group. The second involves opening of an epoxide, aziridine, cyclic thiocarbonate or cyclic sulfite/sulfate.
(i) Addition of a nucleophile to an $\alpha$-amino carbonyl (Scheme 1). ${ }^{27-31}$

(ii) Reduction of $\alpha$-amino carbonyl compounds (Scheme 2). ${ }^{32,33}$

L-Selectride, $98 \%$, 34 : 35, $1: 18$ $\mathrm{BH}_{3} . \mathrm{Me}_{2} \mathrm{~S}, \quad 98 \%, 34: 35,16: 1$

Scheme 2
(iii) Addition of a nucleophile to an $\alpha$-hydroxy imine (Scheme 3). ${ }^{34}$

Scheme 3
(iv) Reductive amination (Scheme 4). ${ }^{35}$

Scheme 4
(v) Ring opening reactions of epoxides (Scheme 5). ${ }^{36,37,38}$

(vi) Ring opening reaction of aziridine (Scheme 6). ${ }^{39,40}$

(vii) Ring opening reactions of cyclic thiocarbonates ${ }^{41,42}$ and cyclic sulfites/sulfates ${ }^{43}$ (Scheme 7).

Scheme 7
Thus, a number of routes using functional group manipulations are available to prepare vicinal amino alcohols. Most of these methods rely upon the stereochemical information already contained within the molecule to control the stereochemistry of the new stereocenter. Thus, these methods generally rely upon some other method to ultimately control the stereochemistry of the vicinal amino alcohol.

## Addition of one heteroatom

There are a number of methods by which one heteroatom can be added to a molecule already containing the other.
(i) Addition of nitrogen (Scheme 8). ${ }^{44}$

(ii) Addition of oxygen (Scheme 9). ${ }^{45}$

## Aminohydroxylation

The hydroxyamination or aminohydroxylation reaction of an olefin is possibly the most basic route to vicinal amino alcohols. Two general methods are known and are listed below.
(i) The method of Davies, wherein a chiral amide anion is added to an $\alpha, \beta$-unsaturated ester, followed by trapping of the enolate with an oxygen electrophile ${ }^{46}$ (Scheme 10).
56

59

Scheme 10
ii) The Sharpless method of metal catalyzed aminohydroxylation in presence of cinchona alkaloid ligands ${ }^{47}$ (Scheme 11).

Scheme 11
The methods of Davies and Sharpless are complementary. The former gives anti- $\alpha$-hydroxy-$\beta$-amino ester, while the latter gives syn-products. In the latter, the regioselectivity can be reversed as below ${ }^{48}$ (Scheme 12).

## Coupling Reactions

There are two general types of coupling reactions that have been used in the synthesis of vicinal amino alcohols.
(i) Aldol reaction in the presence of a chiral catalyst. The Henry reaction ${ }^{49}$ is a typical example (Scheme 13).

Scheme 13
(ii) Pinacol-type reaction ${ }^{50,51}$ (Scheme 14).

Scheme 14

Thus, there are numerous routes to the vicinal amino alcohol moiety. The choice of synthetic route for a given application will vary depending upon substitution, as well as the relative and/or absolute stereochemistry desired. A key theme in many of these methods is the generation of enantiomerically pure compounds. This can be achieved from enantiomerically pure starting material as well as via chiral catalysis. There are still many challenges in the area of vicinal amino alcohol synthesis. Limitations exist for most of the methods. For many, it is a question of substrate. Many of the methods work well for a fairly limited set of molecules. For others, it is an
issue of stereochemistry, both absolute and relative. While many of the methods do, or try to, prepare enantiomerically pure amino alcohols, many methods cannot. In summary, the synthesis of vicinal amino alcohols has seen much work in recent years, but much remains to be done.

In our synthetic endeavors, on the application of SAD reaction towards the synthesis of bioactive molecules, we envisaged to convert the chiral diols into the vicinal amino alcohols via varied functional group transformations.

This chapter consisting of two sections mainly focuses on the synthesis of
(i) D-erythro-dihydrosphingosine: a biosynthetic precursor to sphingolipids, which is a long chain amino alcohol, generally possessing 18 or 20 carbon atoms as the backbone structure. The amino alcohol moiety has been arrived at via the functional group transformation involving,
(a) the regioselective opening of cyclic sulfite prepared from the diol obtained by SAD reaction and
(b) the selective formation of 1,3-cyclic benzylidene from 1,2,3-triol and subsequent conversion of C-2 hydroxyl into an amino group.

These two synthetic routes are described in the first section of this chapter.
(ii) The second section of this chapter covers two aspects:
(a) the exploration of the concept of double diastereoselection in asymmetric dihydroxylation reaction. Here the diastereoselective outcome of SAD reaction under varied chiral ligands on a terminal olefin substrate with existing chirality in close proximity to the reacting olefin bond has been studied.
(b) the results of above double diastereoselection have been successfully applied toward the total synthesis of $\mathrm{C}_{18}$-phytosphingosine isomers.

## ENANTIOSELECTIVE SYNTHESIS OF D-(+)-erythro-DIHYDROSPHINGOSINE

### 3.2.1. Introduction:

Sphingosines constitute a group of related long-chain aliphatic 2 -amino-1,3-diols, of which 2-amino-D-erythro-4(E)-octadecene-1,3-diol (commonly called sphingosine 70) occurs most frequently in animal glycosphingolipids. ${ }^{52}$ Sphingosines are known inhibitors of protein kinase C and are the backbone structures to glycosphingolipids. This larger family of biomolecules is involved in a plethora of processes related to cell growth, differentiation, adhesion, and neuronal repair. ${ }^{53}$

70

71

Glycosphingolipids contain two basic structural motifs: carbohydrate and ceramide (Figure 8). The ceramide portion consists of a sphingoid base and an amide-linked fatty acyl chain, e.g. stearoyl or palmitoyl. The structural variation in fatty acids ( N -acyl portion, sphingosines and carbohydrates results in a great variety of chemically distinct glycosphingolipids. ${ }^{52}$

Figure 8. Glycosphingolipid structure

Glycosphingolipids are found in the cell membrane of all animal and many plant cells, where they serve as identifying markers and regulate cellular recognition, growth and development. ${ }^{54 a}$ They are thought to function by anchoring the hydrophobic ceramide portion (Figure 8) in the plasma membrane exposing the hydrophilic carbohydrate portion to the surrounding exterior which specifies the intended biological function. ${ }^{54 b}$ They are involved in several biological functions such as (i) HIV binding to galactosyl ceramide receptor sites in cells lacking the principal CD4 cellular receptor, ${ }^{55}$ (ii) being unambiguous links between specific sphingolipids and malignant tumors which enables them to be used as 'biological markers' for possible early detection of cancer, ${ }^{54 a}$ and (iii) potent and reversible inhibition of protein kinase C by breakdown products of glycosphingolipids, e.g. sphingosine 70, sphinganine 71 (dihydrosphingosine) and lysophingolipids (Figure 8).

Dihydrosphingosine 71 is a biosynthetic precursor to sphingosine 70 which is the most abundant long chain amino alcohol possessing generally 18 or 20 carbon atoms. Dihydrosphingosine is an intermediate in the biosynthesis of sphingolipids such as ceramides, sphingomyelin, cerebrosides and gangliosides, which play important roles in cell regulation and signal transduction. ${ }^{56}$ Dihydrosphingosine is itself found to be an inhibitor of protein kinase C. ${ }^{57}$
The on-going recognition of glycosphingolipids as fundamental mediators of cellular interactions continues to sustain research in this field.

### 3.2.2. Review of Literature

Although known for more than 100 years, the finding that defects in sphingolipid metabolism lead to several inherited human diseases and the findings that sphingolipids are involved in "essentially all aspects of cell regulation" ${ }^{\circ 58}$ have led to an explosion of interest in sphingolipids. ${ }^{56,58,59}$ Two problems make the utilization of sphingolipids from natural sources problematic. First, there are a large number of known sphingolipids which vary in the head group $\left(\mathrm{R}^{1}\right)$, N -acyl groups ( $\mathrm{R}^{2}$ ) and/or tail group ( $\mathrm{R}^{3}$ ) thus making the isolation of homogeneous material from natural sources difficult. ${ }^{60}$ Second, the allylic alcohol function undergoes epimerization readily during isolation or manipulation to produce partially epimerized mixtures. ${ }^{60}$ For these reasons, synthetic access to individual sphingosines is an attractive alternative.

Quite a number of syntheses of sphingosine, dihydrosphingosine and their derivatives have been reported. In general, these can be grouped into three main catergories ${ }^{61}$ as under:
(1) The first uses stereoselective addition of an organometallic reagent (often a lithium acetylide) to a protected serinal. ${ }^{62}$ This approach forms the 3,4 carbon-carbon bond and sets the stereochemistry of the C-3 hydroxyl group in one step.

(2) The second major strategy uses carbohydrate precursors as the source of stereochemistry at C-2 and C-3. The tail is often attached by an anionic addition of some type. ${ }^{61,63}$

(3) The third major category uses a variety of chiral precursors to build up the structures by nucleophilic addition processes. ${ }^{64}$

All these approaches set the stereochemistry of the head groups early and attach the tail as a nucleophile. Most synthetic approaches describe the synthesis of sphingosine and its derivatives. However, saturation of the olefin bond in sphingosine gives sphinganine. Hence all syntheses leading to sphingosine could be elaborated to sphinganine syntheses. Some synthetic routes are developed to produce the dihydrosphingosine directly. A few interesting syntheses of sphinganine (dihydrosphingosine) are discussed below:

## Grob et al. (1951) ${ }^{65}$ Scheme 15

An early synthesis of racemic dihydrosphingosine ( $\pm$ )-71 was reported by Grob and coworkers employing nitroaldol reaction. Condensation of nitroethanol 72 with palmitaldehyde 73 gave the aldol product 74. Reduction of the nitro group in 74 afforded racemic dihydrosphingosine ( $\pm$ )-71.

Scheme 15. Reaction conditions: (i) OH . (ii) $\mathrm{H}_{2} / \mathrm{Ni}$.
In another approach, Grob and Gadient ${ }^{66}$ (Scheme 16) carried out nitroaldol reaction on hexadecynal 75 to give 1:1 mixture of threo- and erythro- products 76 and 77 respectively. Diastereomer 77 was separated by fractional crystallization. Sequential nitro group reduction followed by complete reduction of the triple bond furnished D-erythro-dihydrosphingosine 71.

Scheme 16. Reaction conditions: (i) $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{MeOH}$. (ii) (a) $\mathrm{Zn}, \mathrm{HCl}$, (b) $\mathrm{H}_{2} / \mathrm{Pd}$.

## Reist et al. (1970) ${ }^{67}$ Scheme 17

In Reist's approach, the readily available 3-amino-3-deoxy-1, 2:5,6-di- $O$-isopropylidene- $\alpha$-Dallofuranose $\mathbf{7 8}^{68}$ was protected at the amino group with benzylchloroformate and selective removal of the 5,6-isopropylidene group gave the diol 79. Periodate cleavage of the diol and subsequent Wittig reaction on the aldehyde produced a mixture of cis- and trans-olefin $\mathbf{8 0}$. Acetonide deprotection and periodate cleavage of the diol gave the aldehyde, which was subsequently reduced to afford $\mathbf{8 1}$. Hydrogenation of $\mathbf{8 1}$ gave D-erythro-dihydrosphingosine 71.

Scheme 17. Reaction conditions: (i) (a) CBzCl , pyridine, $\mathscr{O}^{\circ} \mathrm{C}, 18 \mathrm{~h}, 64 \%$, (b) $75 \%$ aq. AcOH , $60^{\circ} \mathrm{C}, 20 \mathrm{~min}, \sim 100 \%$. ## Mori et al. (1981) ${ }^{69}$ Scheme 18

Mori and Umemura employed the asymmetric epoxidation approach towards the synthesis of D-erythro-dihydrosphingosine. Sharpless asymmetric epoxidation (SAE) of allylic alcohol 82 gave the epoxide 83, which on opening with $\mathrm{NH}_{3} / \mathrm{MeOH}$ afforded a mixture of regioisomers 71 and 84. Acetylation of the mixture gave the corresponding N -acetates $\mathbf{8 5}$ and 86 . The unwanted isomer 86 was removed by $\mathrm{HIO}_{4}$ treatment. Acetylation of 85 yielded the triacetate 87 .

Scheme 18. Reaction conditions: (i) (-)-DET, $t-\mathrm{BuOOH}, \mathrm{Ti}(\mathrm{Oi}-\mathrm{Pr})_{4}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-20^{\circ} \mathrm{C}, 38 \mathrm{~h}, 75 \%$. (ii) $\mathrm{NH}_{3}, \mathrm{MeOH}, 100^{\circ} \mathrm{C}, 7 \mathrm{~d}, 99 \%$. (iii) $\mathrm{Ac}_{2} \mathrm{O}, \mathrm{MeOH}, 98 \%$. (iv) $\mathrm{Ac}_{2} \mathrm{O}$, pyridine, $73 \%$.

## Roush et al. (1985) ${ }^{70}$ Scheme 19

Roush and Adam employed the epoxyurethane intermediate in the synthesis of 71. The allylic alcohol 82 on SAE gave epoxide 83, which was converted into epoxyurethane 88. Opening of the epoxyurethane $\mathbf{8 8}$ under basic conditions led to internal delivery of nitrogen to give a mixture of urethanes 89 and 90 which on debenzylation furnished 91 and 92 . The subsequent hydrolysis followed by acetylation furnished the desired compound 87 .

Scheme 19. Reaction conditions: (i) (-)-DET, $t$ - $\mathrm{BuOOH}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-20^{\circ} \mathrm{C}, 24 \mathrm{~h}, 88 \%$. (ii) $\mathrm{PhCH}_{2} \mathrm{NCO}, \mathrm{Et}_{3} \mathrm{~N}$, overnight, $97 \%$. (iii) $\mathrm{NaH}, \mathrm{THF}, 23^{\circ} \mathrm{C}, 88 \%$. ## Cardillo et al. (1986) ${ }^{71}$ Scheme 20

In Cardillo's approach, ( $Z$ )-1-trichloroacetimidoyloxyoctadec-2-ene 97 easily obtained from 96 was iodocyclized with NIS to give the 4,5-dihydro-oxazole 98 . The neutral cleavage of 98 gave the corresponding amide, which on treatment with Amberlyst A 26 afforded 100 together with a minor amount of aziridine 101. After hydrolysis of the oxazole and acetylation, D-erythro-dihydrosphingosine 71 was obtained as triacetate 87.

Scheme 20. Reaction conditions: (i) (a) LDA, THF, 3 h , rt, (b) $\mathrm{C}_{15} \mathrm{H}_{31} \mathrm{I}, \mathrm{THF}, 12 \mathrm{~h}, 55^{\circ} \mathrm{C}, 75 \%$. (ix) $\mathrm{Ac}_{2} \mathrm{O}$, pyridine, 18 h .

## Schmidt et al. (1995) ${ }^{72}$ Scheme 21

Schmidt et al. employed 2-deoxy-D-galactose $\mathbf{1 0 3}$ as the starting material which can be easily prepared from D-galactose. ${ }^{73}$ Wittig reaction with dodecyltriphenylphosphoniumbromide and $t$ BuOK gave the ( $4 E, 6 Z$ )-diene 105, presumably first by base mediated $\beta$-elimination to $\mathbf{1 0 4}$ followed by ( $Z$ )-selective Wittig reaction. Mesylation of the C-2 hydroxyl and hydrogenation afforded 106. Acetylation of the free hydroxyl and azide displacement of mesylate gave 107. Removal of acetyl protection and reduction of azide followed by acetylation afforded 87.

Scheme 21. Reaction conditions: (i) $\mathrm{C}_{12} \mathrm{H}_{25} \mathrm{P}^{+} \mathrm{Ph}_{3} \mathrm{Br}^{-}, t$ - $\mathrm{BuOK}, \mathrm{PhCH}_{3}, 89 \%$. (ii) (a) MsCl , pyridine, $70^{\circ} \mathrm{C}, 2 \mathrm{~h}, 81 \%$, (b) $\mathrm{Pd} / \mathrm{C}, \mathrm{H}_{2}, \mathrm{MeOH} / \mathrm{EtOAc}, 24 \mathrm{~h}, 91 \%$. (iii) (a) $\mathrm{Ac}_{2} \mathrm{O}$, pyridine, 4 h , $100 \%$, (b) $\mathrm{NaN}_{3}, \mathrm{DMF}, 100^{\circ} \mathrm{C}, 3 \mathrm{~d}, 84 \%$. (iv) (a) $\mathrm{MeOH}, \mathrm{NaOMe}, 2 \mathrm{~h}$, (b) Amberlite IR 120, (c) Pyridine/water, $\mathrm{H}_{2} \mathrm{~S}, \mathrm{rt}, 4 \mathrm{~h}, 70 \%$. (v) $\mathrm{Ac}_{2} \mathrm{O}$, pyridine, $\mathrm{rt}, 12 \mathrm{~h}, 90 \%$.

## Buono et al. (1998) ${ }^{74}$ Scheme 22

Buono synthesized analogs of dihydrosphingosine with a shortened alkyl chain via diastereoselective addition of hexyl magnesium bromide 108 or dihexylzinc 109 to a chiral aldehyde 28 (Garner aldehyde). Thus, reaction of $\mathbf{1 0 8}$ with 28 gave a diastereomeric mixture of 110 and $\mathbf{1 1 1}$ in 95:5 ratio, while addition of $\mathbf{1 0 9}$ to $\mathbf{2 8}$ afforded $\mathbf{1 1 0}$ and $\mathbf{1 1 1}$ in 9:91 ratio.

Treatment of pure alcohols $\mathbf{1 1 0}$ and $\mathbf{1 1 1}$ with benzoyl chloride followed by acidic hydrolysis led to amino alcohols $\mathbf{1 1 2}$ and $\mathbf{1 1 3}$ respectively.

Scheme 22. Reaction conditions: (i) $\mathrm{RM}, 25^{\circ} \mathrm{C}$, solvent, $67-90 \%$. (ii) (a) $\mathrm{PhCOCl}, \mathrm{DMAP}$, pyridine, $\mathrm{PhCH}_{3}$, (b) 5 N HCl , dioxane, reflux, $45 \mathrm{~min}, 71 \%$.

## Masui et al. (1998) ${ }^{75}$ Scheme 23

Masui et al. employed asymmetric borane reduction of $\alpha$-ketoxime trityl ether towards the synthesis of both threo- and erythro-dihydrosphingosine. Butylnitrite reaction with $\beta$-ketoester 115 and $O$-tritylation afforded $\alpha$-ketoxime trityl ether 116. Sequential reduction of 116, protection of primary hydroxyl and Swern oxidation gave 117. Asymmetric borane reduction of 116 with 0.2 eq. of $\mathbf{1 1 8}$ gave predominantly threo-isomer 119 ( $95 \%$ ee). On the other hand, reduction of $\mathbf{1 1 7}$ with 0.2 eq. of $\mathbf{1 1 8}$ afforded erythro-dihydrosphingosine $\mathbf{7 1}$ in $97 \%$ ee.

Scheme 23. Reaction conditions: (i) $\mathrm{KO}_{2} \mathrm{CCH}_{2} \mathrm{CO}_{2} \mathrm{Me}, \mathrm{MgCl}_{2}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{3} \mathrm{CN}, \mathrm{rt}, 18 \mathrm{~h}, 52 \%$. (ii) (a) BuONO , conc. $\mathrm{H}_{2} \mathrm{SO}_{4}, \mathrm{Et}_{2} \mathrm{O}, \mathrm{rt}, 1.5 \mathrm{~h}, 85 \%$, (b) $\mathrm{TrCl}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rt}, 2 \mathrm{~h}, 99 \%$. (iii) (a) $\mathrm{NaBH}_{4}, \mathrm{EtOH}, \mathrm{rt}, 1 \mathrm{~h}, 99 \%$, (b) $t$ - $\mathrm{BuMe}_{2} \mathrm{Si} \mathrm{Cl}$, imidazole, DMF, rt, $24 \mathrm{~h}, 85 \%$, (c) $(\mathrm{COCl})_{2}$, DMSO, $\mathrm{CH}_{2} \mathrm{Cl}_{2},-78^{\circ} \mathrm{C}, 15 \mathrm{~min}$, then $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{rt}, 1 \mathrm{~h}, 99 \%$. (iv) Borane- $\mathrm{N}, \mathrm{N}$-diethylaniline
complex, 0.2 eq. 118, reflux, $65 \mathrm{~h}, 90 \%$. (v) (a) Borane- $\mathrm{N}, \mathrm{N}$-diethylaniline complex, 0.2 eq. 118, $3 \mathrm{~h}, \mathrm{rt}, 18 \mathrm{~h}$, reflux, $94 \%$, (b) 2 N HCl .

## Hoffman et al. (1998) ${ }^{76}$ Scheme 24

Hoffman et al. employed L-serine-based synthesis of D-erythro-dihydrosphingosine via a 3ketosphinganine intermediate. L-(N-BOC)-serine methyl ester $\mathbf{1 2 0}$ was protected as oxazolidine, followed by conversion to $\beta$-ketoester $\mathbf{1 2 1}$ with CDI and lithioallylacetate. $\beta$-Ketoester $\mathbf{1 2 1}$ was alkylated with tetradecyltriflate followed by deallylation and decarboxylation to give the 3ketosphinganine 122. Reduction of $\mathbf{1 2 2}$ furnished D-erythro-dihydrosphingosine derivative $\mathbf{1 2 3}$.

Scheme 24. Reaction conditions: (i) (a) 2,2-DMP, p-TsOH, (b) LiOH , (c) CDI , then $\mathrm{LiCH}_{2} \mathrm{CO}_{2}$ allyl. (iv) (a) $\mathrm{CF}_{3} \mathrm{CO}_{2} \mathrm{H}$, rt, (b) $\mathrm{Ac}_{2} \mathrm{O}, \mathrm{DMAP}, \mathrm{rt}, 83 \%$.

### 3.2.3. Present Work

The SAD reaction of trans- $\alpha, \beta$-unsaturated esters ${ }^{78 a}(\mathbf{1 2 6})$ and long chain terminal transallylic alcohols ${ }^{78 \mathrm{~b}}(\mathbf{1 2 8})$ is reported to give the corresponding dihydroxy esters (127) and 1,2,3trihydroxy compounds (129) respectively in high enantiomeric purity.

Thus, SAD reaction establishes the C-3 hydroxyl group of dihydrosphingosine, while the C-2 hydroxyl could be manipulated into amine functionality by standard synthetic transformation. We adopted two strategies towards the introduction of amino group. In the case of $\alpha, \beta$ dihydroxy esters (127), cyclic sulfites/sulfates (130) proved to be promising intermediates for high reactivity in nucleophilic opening reactions and also provide high regioselectivity at the $\alpha$ carbon with inversion at the $\mathrm{C}-2$ center. ${ }^{43}$

In case of terminal triol (129) selective formation of cyclic benzylidene (133) gives 1,3hydroxyl protection, leaving the C-2 hydroxyl free, which can be converted, into amino group with inversion at $\mathrm{C}-2$ center.

Thus, the objective of the present investigation is to employ the SAD reaction to fix the C-3 chirality and the chemistry of cyclic sulfites/sulfates or the selective 1,3-cyclic benzylidene formation to achieve the $\mathrm{C}-2$ chirality of D-erythro-dihydrosphingosine. Thus, this synthetic strategy proves to be a short and practical approach to D-erythro-dihydrosphingosine in high enantiomeric purity.

### 3.2.4. Results and Discussion

The synthesis of D-erythro-dihydrosphingosine commences from hexadecanal 135 as shown in Scheme 26. Reaction of 135 with (ethoxycarbonylmethylene)triphenylphosphorane in THF under reflux gave the Wittig product 136 in $87 \%$ yield. The IR spectrum of $\mathbf{1 3 6}$ showed the ester carbonyl absorption at $1724 \mathrm{~cm}^{-1}$ and olefin $\mathrm{C}=\mathrm{C}$ stretching at $1655 \mathrm{~cm}^{-1}$. The ${ }^{1} \mathrm{H}$ NMR spectrum gave olefin protons at $\delta 5.8$ (doublet of triplet) and 6.97 (doublet of triplet) with the coupling constant $J=15.63 \mathrm{~Hz}$ indicating trans-olefin. The SAD reaction of 136 using (DHQD) $)_{2}$-PHAL as chiral ligand gave the diol 137 in excellent yield, having $[\alpha]_{\mathrm{D}}{ }^{20}+8.6\left(\mathrm{c}=2, \mathrm{CHCl}_{3}\right) .{ }^{79}$ The IR spectrum of 137 gave hydroxyl absorption at $3400-3300 \mathrm{~cm}^{-1}$ and ester carbonyl at $1732 \mathrm{~cm}^{-1}$. The ${ }^{1} \mathrm{H}$ NMR spectrum indicated absence of olefin protons. The chiral protons appeared at $\delta 3.88$ (multiplet) and 4.08 (doublet of doublet). The chiral carbons appeared at $\delta 72.5$ and 73.2 in the ${ }^{13} \mathrm{C}$ NMR spectrum.

Scheme 26. Reaction conditions: (i) $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{CHCO}_{2} \mathrm{Et}, \mathrm{THF}$, reflux, $18 \mathrm{~h}, 87 \%$. (ii) ( DHQD$)_{2}-$ PHAL, $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}, \mathrm{~K}_{2} \mathrm{CO}_{3}, \mathrm{OsO}_{4}$ (cat), $\mathrm{MeSO}_{2} \mathrm{NH}_{2}, t$ - $\mathrm{BuOH}: \mathrm{H}_{2} \mathrm{O}$ (1:1), $0^{\circ} \mathrm{C}, 24 \mathrm{~h}, 94 \%$. (iii) $\mathrm{SOCl}_{2}, \mathrm{CCl}_{4}$, reflux, $1.5 \mathrm{~h}, 96 \%$. (iv) (a) $\mathrm{LiN}_{3}, \mathrm{DMF}, 100^{\circ} \mathrm{C}, 18 \mathrm{~h}$, (b) $20 \% \mathrm{H}_{2} \mathrm{SO}_{4}: \mathrm{Et}_{2} \mathrm{O}$ (1:1), rt, $12 \mathrm{~h}, 68 \%$. (v) (a) $\mathrm{LiAlH}_{4}, \mathrm{Et}_{2} \mathrm{O}, 0^{\circ} \mathrm{C}$ to rt, overnight, (b) $\mathrm{Ac}_{2} \mathrm{O}$, pyridine, rt, $18 \mathrm{~h}, 76 \%$.

The diol 137 was then treated with thionyl chloride to afford the cyclic sulfite $\mathbf{1 3 8}$ in $96 \%$ yield. The IR spectrum of $\mathbf{1 3 8}$ showed absence of hydroxyl absorption. The ${ }^{1} \mathrm{H}$ NMR spectrum showed diastereomeric peaks (for cyclic sulfite being diastereomeric at $S$ atom) at $\delta 4.50$ (doublet) 0.5 proton, $4.6-4.68$ (multiplet) 0.5 proton, 5.05 (doublet) 0.5 proton and 5.09-5.17 (multiplet) 0.5 proton. The essential feature of our synthetic strategy shown in Scheme 26 was based on the presumption that the nucleophilic opening of the cyclic sulfite $\mathbf{1 3 8}$ would occur in a
regioselective manner at the $\alpha$-carbon. Indeed the cyclic sulfite $\mathbf{1 3 8}$ on treatment with lithium azide furnished the azido alcohol 139 in $68 \%$ yield. The IR spectrum of $\mathbf{1 3 9}$ showed hydroxyl absorption at $3476 \mathrm{~cm}^{-1}$ and strong azide absorption at $2109 \mathrm{~cm}^{-1}$. Reduction of azido and ester functionality in 139 with lithium aluminium hydride and subsequent acetylation of the crude amino alcohol with acetic anhydride in pyridine gave the triacetate 87 of D-erythrodihydrosphingosine 71 in $76 \%$ yield, having $[\alpha]_{\mathrm{D}}{ }^{20}+17.2\left(\mathrm{c}=0.2, \mathrm{CHCl}_{3}\right)\left[\right.$ lit. $[\alpha]_{\mathrm{D}}{ }^{23}+16.8$ (c $\left.\left.=1, \mathrm{CHCl}_{3}\right)^{72}[\alpha]_{\mathrm{D}}{ }^{25}+17.4\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)^{77}\right]$. The triacetate 87 was fully characterized by IR, ${ }^{1}$ H NMR and EIMS spectral data. The IR spectrum of 87 showed NH of amide at $3291 \mathrm{~cm}^{-1}$ and the carbonyls of acetates and amide at 1730 and $1646 \mathrm{~cm}^{-1}$ respectively. ${ }^{1} \mathrm{H}$ NMR spectrum gave acetyl methyl as three singlets at $\delta 1.97,2.00$ and 2.02 . The chiral protons appeared at $\delta 4.33-$ 4.37 (multiplet, one proton) and 4.98-5.01 (multiplet, one proton). The amide proton gave a doublet at $\delta$ 5.77-5.8 with coupling constant $J=8 \mathrm{~Hz}$. The EIMS of $\mathbf{8 7}$ gave a molecular ion $\left[\mathrm{M}^{+}\right]$peak at $m / z 427$ and other characteristic peaks at $m / z 308,188$ and 84 . The physical constants for 87 obtained were in full agreement with the literature values. ${ }^{72,77}$

An alternative sequence of reactions to arrive at the target molecule $\mathbf{8 7}$ is depicted in Scheme 27. In this case the $\mathrm{C}-2$ chirality is arrived at through selective 1,3 -cyclic benzylidene formation. The $\alpha, \beta$-unsaturated ester 136 was subjected to DIBAL-H reduction to furnish the corresponding allylic alcohol $\mathbf{8 2}$ in $92 \%$ yield. The IR spectrum of $\mathbf{8 2}$ showed hydroxyl absorption at $3330 \mathrm{~cm}^{-1}$ and absence of ester carbonyl. The dihydroxylation of olefin $\mathbf{8 2}$ with osmium tetroxide and potassium ferricyanide as co-oxidant in the presence of 1,4-bis(9-Odihydroquinidine)phthalazine $\left[(\mathrm{DHQD})_{2}\right.$-PHAL] ligand under the Sharpless asymmetric dihydroxylation reaction condition gave the $(2 R, 3 R)$-triol 140 in excellent yield, having $[\alpha]_{\mathrm{D}}{ }^{20}+$ 7.2 ( $\left.\mathbf{c}=1.0, \mathrm{CHCl}_{3}\right)$. The SAD of allylic alcohols with different long alkyl chains is reported to give the two stereogenic centers in $95-97 \%$ enantiomeric excess. ${ }^{78 \mathrm{~b}}$ Thus by analogy, the triol 140 prepared was assumed to be enantiomerically pure. The IR spectrum showed hydroxyl absorption at $3400-3200 \mathrm{~cm}^{-1}$ and absence of olefin $\mathrm{C}=\mathrm{C}$ stretching. In the ${ }^{1} \mathrm{H}$ NMR spectrum the chiral protons appeared at $\delta$ 3.47-3.51 (multiplet) and 3.56-3.82 (multiplet). The EIMS gave the molecular ion $\left[\mathrm{M}^{+}\right]$peak at $m / z$ 302. Further, in order to achieve the synthesis of azido sphinganine $\mathbf{1 4 3}$ from the triol 140 , we required the transformation of $\mathrm{C}-2$ hydroxyl group to azido with concomitant reversal of stereochemistry. Towards this aim, the benzylidene protection of $\mathbf{1 4 0}$ was effected with benzaldehyde dimethylacetal in the presence of a catalytic amount of $p$-TsOH to afford a mixture of 1,3- and 1,2-benzylidene compounds in 9:1 ratio. The

Scheme 27. Reaction conditions: (i) $\mathrm{DIBAL}^{2} \mathrm{H}, \mathrm{Et}_{2} \mathrm{O}, 0^{\circ} \mathrm{C}, 92 \%$. (ii) ( DHQD$)_{2}-\mathrm{PHAL}, \mathrm{OsO}_{4}$, $\mathrm{MeSO}_{2} \mathrm{NH}_{2}, \mathrm{~K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}, \mathrm{~K}_{2} \mathrm{CO}_{3}, t$ - $\mathrm{BuOH}: \mathrm{H}_{2} \mathrm{O}(1: 1), 24 \mathrm{~h}, 0^{\circ} \mathrm{C}, 91 \%$. (iii) $\mathrm{PhCH}(\mathrm{OMe})_{2}, p-$ $\mathrm{TsOH}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, rt, overnight, $69 \%$. (iv) (a) $\mathrm{MeSO}_{2} \mathrm{Cl}, \mathrm{Et}_{3} \mathrm{~N}$, DMAP, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, rt, overnight, (b) $\mathrm{NaN}_{3}, \mathrm{DMF}, 80^{\circ} \mathrm{C}, 24 \mathrm{~h}, 83 \%$. (v) $3 \mathrm{~N} \mathrm{HCl}, \mathrm{MeOH}$, rt, overnight, $72 \%$. (vi) (a) $\mathrm{LiAlH}_{4}, \mathrm{Et}_{2} \mathrm{O}$, $0^{\circ} \mathrm{C}$, rt , overnight, (ii) $\mathrm{Ac}_{2} \mathrm{O}$, pyridine, $\mathrm{rt}, 18 \mathrm{~h}, 71 \%$.
desired major 1,3-benzylidene compound $\mathbf{1 4 1}$ was separated by silica gel column chromatography and obtained in $69 \%$ yield. Compound 141 showed acetal proton at $\delta 5.58$ (singlet) in the ${ }^{1} \mathrm{H}$ NMR spectrum. Compound 141 was then converted into 5 - $O$-mesylate with methanesulfonyl chloride using $\mathrm{Et}_{3} \mathrm{~N}$ and catalytic DMAP. The crude mesylate was treated with sodium azide in DMF to give the azido compound 142 with desired stereochemistry at 5position. Compound 142 showed absence of hydroxyl absorption in the IR spectrum and strong azide absorption at $2097 \mathrm{~cm}^{-1}$. The benzylidene protecting group was cleaved by treating $\mathbf{1 4 2}$ with 3 N HCl to furnish the azido sphinganine $\mathbf{1 4 3}$ in $72 \%$ yield, which was identical in all respects with the reported compound. ${ }^{72}$ The IR spectrum of $\mathbf{1 4 3}$ gave hydroxyl absorption at $3450-3400 \mathrm{~cm}^{-1}$ and azide absorption at $2100 \mathrm{~cm}^{-1}$. The EIMS gave the molecular ion $\left[\mathrm{M}^{+}\right]$peak at $m / z$ 327. Transformation of azido alcohol 143 into the target molecule 87 was readily performed by reduction with lithium aluminium hydride followed by subsequent acetylation with acetic anhydride in pyridine to give 87 in $71 \%$ yield, having m.p. $95-97^{\circ} \mathrm{C}$ (lit. $95-97^{\circ} \mathrm{C}$ ) ${ }^{72}$ and $[\alpha]_{\mathrm{D}}{ }^{20}+17.0\left(\mathrm{c}=0.2, \mathrm{CHCl}_{3}\right)\left[\right.$ lit. $\left.+16.8\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)^{72}\right]$. Spectroscopic data were in full agreement with 87 prepared according to Scheme 26.

### 3.2.5. Conclusion

In conclusion, an asymmetric synthesis of D-erythro-dihydrosphingosine (sphinganine) as the triacetate has been realized using the Sharpless asymmetric dihydroxylation as the source of chirality for the first time. ${ }^{80}$ We have successfully employed the chemistry of cyclic sulfites/sulfates or the cyclic 1,3-benzylidene to achieve the required stereochemistry of the C-2 centre of D-erythro-dihydrosphingosine. The merits of this synthesis are high-yielding reaction steps, high enantioselectivity and various possibilities available for structural modifications. The other enantiomer could be synthesized via $\alpha$-dihydroxylation of olefin and following the reaction sequence as discussed above.

### 3.2.6. Experimental section

## General information:

Solvents were purified and dried by standard procedures before use. Petroleum ether of boiling range $60-80^{\circ} \mathrm{C}$ was used. Melting points are uncorrected. Optical rotations were measured using sodium D line on JASCO-181 digital polarimeter. Infrared spectra were recorded on ATI MATTSON RS-1 FT-IR spectrometer. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR were recorded on Bruker AC-200 and MSL 300 NMR spectrometers respectively. Mass spectra were obtained with a Finnigan MAT-1020 B-70 eV mass spectrometer. Elemental analyses were carried out on a Carlo Erba CHNS-O analyzer. Enantiomeric excess was determined by chiral HPLC or otherwise indicated.

## Preparation of ethyl trans-octadec-2-enoate, 136

To a solution of (ethoxycarbonylmethylene)triphenylphosphorane ( $5.65 \mathrm{~g}, 16.22 \mathrm{mmol}$ ) in dry THF ( 35 mL ) was added dropwise a solution of hexadecanal $135(3 \mathrm{~g}, 12.47 \mathrm{mmol})$ in THF ( 5 mL ) at room temperature. The reaction mixture was refluxed for 18 h . The solvent was removed
under reduced pressure and the crude product was purified on a silica gel column using petroleum ether:EtOAc (9:1) as eluent to give $\mathbf{1 3 6}(3.37 \mathrm{~g})$ as a white solid.
Yield: $3.37 \mathrm{~g}, 87 \%$

## Synthesis of (4S,5R)-4-ethoxycarbonyl-5-pentadecyl-1,3,2-dioxathiolane-2-oxide, 138

A two necked round bottom flask equipped with a reflux condenser topped with a $\mathrm{CaCl}_{2}$ guard tube and a rubber septum was charged with diol $137(2.00 \mathrm{~g}, 5.8 \mathrm{mmol})$ and dry $\mathrm{CCl}_{4}(15 \mathrm{~mL})$. Thionyl chloride ( $1.043 \mathrm{~g}, 0.64 \mathrm{~mL}, 8.77 \mathrm{mmol}$ ) was added through a syringe and the reaction mixture was refluxed for 1.5 h . After completion of reaction, the reaction mixture was cooled and water ( 5 mL ) and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL}$ ) were added. The organic layer was separated and aqueous layer extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 20 \mathrm{~mL})$. The combined organic layers were washed with saturated $\mathrm{NaHCO}_{3}(20 \mathrm{~mL})$, brine ( 30 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and passed through a pad of silica gel. The filtrate was concentrated and the crude product was purified on a silica gel column using petroleum ether:EtOAc (9:1) as eluent to give $\mathbf{1 3 8}(2.176 \mathrm{~g})$ as a colorless oil.

Yield: $2.176 \mathrm{~g}, 96 \%$

## Synthesis of ethyl-(2R,3R)-2-azido-3-hydroxyoctadecanoate, 139

To a solution of cyclic sulfite $138(0.5 \mathrm{~g}, 1.28 \mathrm{mmol})$ in dry DMF ( 10 mL ) was added $\mathrm{LiN}_{3}$ $(0.125 \mathrm{~g}, 2.56 \mathrm{mmol})$ under argon. The reaction mixture was stirred at $100^{\circ} \mathrm{C}$ for 18 h under argon. The solvent was removed under reduced pressure and to the residue, was added $20 \% \mathrm{aq}$. $\mathrm{H}_{2} \mathrm{SO}_{4}: \mathrm{Et}_{2} \mathrm{O}(1: 1,10 \mathrm{~mL})$ and stirred at room temperature for 12 h . Excess $\mathrm{NaHCO}_{3}$ was added to it and the reaction mixture was stirred for 20 min and then extracted with ether ( $3 \times 20 \mathrm{~mL}$ ). The organic layer was separated and passed through celite and silica gel bed. Removal of solvent afforded the crude product as a dark yellow oil which was purified on a silica gel column using petroleum ether:EtOAc (3:1) as eluent to give $\mathbf{1 3 9}(0.321 \mathrm{~g})$ as a colorless low melting solid.

Yield: $0.321 \mathrm{~g}, 68 \%$

## Synthesis of (2S,3R)-2-acetamido-1,3-diacetoxyoctadecane, 87

To a stirred suspension of $\mathrm{LiAlH}_{4}(25 \mathrm{mg}, 0.66 \mathrm{mmol})$ in dry $\mathrm{Et}_{2} \mathrm{O}(8 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added dropwise a solution of $\mathbf{1 3 9}(100 \mathrm{mg}, 0.27 \mathrm{mmol})$ in $\mathrm{Et}_{2} \mathrm{O}(5 \mathrm{~mL})$ through a syringe. The reaction mixture was subsequently warmed to room temperature and stirred overnight. It was next hydrolyzed with water ( 1 mL ) and filtered through celite. The celite bed was washed with MeOH $(3 \times 20 \mathrm{~mL})$. The total filtrate was concentrated to an off white solid, which was subsequently acetylated with $\mathrm{Ac}_{2} \mathrm{O}(0.5 \mathrm{~mL})$ and pyridine ( 1 mL ). After stirring for 18 h , the solvent was stripped off under reduced pressure and the residue was purified on a silica gel column using petroleum ether:EtOAc (1:1) as eluent to give the triacetate $87(0.088 \mathrm{~g})$ as a white solid. It was further recrystallised from petroleum ether/EtOAc.

Yield: $0.088 \mathrm{~g}, 76 \%$

## Synthesis of (2R,3R)-2-azido-1,3-O-benzylideneoctadecane-1,3-diol, 142

To a solution of $141(0.5 \mathrm{~g}, 1.28 \mathrm{mmol})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added methanesulfonylchloride ( $0.254 \mathrm{~g}, 2.2 \mathrm{mmol}$ ), $\mathrm{Et}_{3} \mathrm{~N}(0.5 \mathrm{~mL})$ and DMAP (cat). The reaction
mixture was stirred at room temperature overnight and then poured into $\mathrm{Et}_{2} \mathrm{O}-\mathrm{H}_{2} \mathrm{O}$ mixture. The organic phase was separated and the aqueous phase extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL})$. The combined organic phases were washed with water, brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated to a yellow waxy solid, which was used as such in the next step.

To the solution of above mesylate in dry DMF ( 20 mL ) was added sodium azide ( $0.42 \mathrm{~g}, 6.4$ mmol ) and the reaction mixture stirred at $80^{\circ} \mathrm{C}$ for 24 h . It was cooled and poured into water and extracted with petroleum ether:acetone ( $9.5: 0.5,4 \times 20 \mathrm{~mL}$ ). The organic extracts were washed with water, brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. Column chromatography on silica gel column using petroleum ether:acetone $(9.5: 0.5)$ as eluent gave $142(0.44 \mathrm{~g})$ as a white solid.
Yield: $0.44 \mathrm{~g}, 83 \%$
M.p.: $109-110^{\circ} \mathrm{C}$
$[\alpha]_{D}^{20}:-6.6\left(\mathrm{c}=1.0, \mathrm{CHCl}_{3}\right)$

## Synthesis of (2S,3R)-2-azidooctadecane-1,3-diol, 143

To a solution of $142(0.1 \mathrm{~g}, 0.24 \mathrm{mmol})$ in methanol ( 10 mL ) was added $3 \mathrm{~N} \mathrm{HCl}(1 \mathrm{~mL})$. The mixture was stirred for 24 h at room temperature. The reaction mixture was concentrated and coevaporated with toluene $(2 \times 10 \mathrm{~mL})$. The residue thus obtained was triturated with nhexane to afford he crude product, which was recrystallized from EtOAc/n-hexane to give $\mathbf{1 4 3}(0.057 \mathrm{~g})$ as a white solid.

Yield: $0.057 \mathrm{~g}, 72 \%$
M.p.: $78-80^{\circ} \mathrm{C}\left(\text { lit. } 77-79^{\circ} \mathrm{C}\right)^{72}$

EIMS (m/z relative intensity, \%): 327 [ $\left.\mathrm{M}^{+}\right]$(2.3), 285 (100), 267 (15.6), 239 (10.4), 167 (6.7).

## Synthesis of (2S,3R)-2-acetamido-1,3-diacetoxyoctadecane, 87

87
To a suspension of $\mathrm{LiAlH}_{4}(4.7 \mathrm{mg}, 123 \mu \mathrm{~mol})$ in $\mathrm{Et}_{2} \mathrm{O}(10 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added a solution of $143(20 \mathrm{mg}, 61 \mu \mathrm{~mol})$ in $\mathrm{Et}_{2} \mathrm{O}(2 \mathrm{~mL})$. The reaction mixture was subsequently warmed to room temperature and stirred overnight. Excess $\mathrm{LiAlH}_{4}$ was destroyed by slow addition of $5 \%$ aq NaOH till effervescence ceased. EtOAc ( 10 mL ) was added and the white cake was filtered and washed with EtOAc ( $3 \times 10 \mathrm{~mL}$ ). The organic layer was dried $\left(\mathrm{K}_{2} \mathrm{CO}_{3}\right)$ and concentrated to an off white solid, which was subsequently acetylated with $\mathrm{Ac}_{2} \mathrm{O}(0.15 \mathrm{~mL})$ and pyridine $(1 \mathrm{~mL})$. After stirring for 24 h , the solvent was co-evaporated with toluene and the residue was purified on a silica gel column using petroleum ether:EtOAc (1:1) as eluent to give the triacetate $\mathbf{8 7}$ $(0.0185 \mathrm{~g})$ as a white solid. It was further recrystallized from hexane/EtOAc.
Yield: $0.0185 \mathrm{~g}, 71 \%$

$[\alpha]_{\underline{\mathbf{D}}}{ }^{\mathbf{2 0}}:+17.0\left(\mathrm{c}=0.2, \mathrm{CHCl}_{3}\right)\left[\right.$ lit. $\left.+16.8\left(\mathrm{c}=1, \mathrm{CHCb}_{3}\right),{ }^{72}+17.4\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)^{77}\right]$
The spectroscopic data were in full agreement with 87 prepared as per Scheme 26.

### 3.3. SECTION B

## DOUBLE DIASTEREOSELECTION IN ASYMMETRIC DIHYDROXYLATION: APPLICATION TO THE DIASTEREOSELECTIVE SYNTHESIS OF $\mathrm{C}_{18}$-PHYTOSPHINGOSINES

### 3.3.1. Introduction

## Double Diastereoselection in Asymmetric Dihydroxylation

Asymmetric dihydroxylation of prochiral olefins gives high levels of enantioselectivities with the recent developments in reaction conditions and ligands. But, what about asymmetric dihydroxylation of chiral olefins? For a given case, a determination of the intrinsic diastereofacial selectivity of a chiral substrate is helpful in order to estimate the likelihood of success, especially in the "mismatched" pairing. ${ }^{81}$ This is most easily accomplished by carrying out the osmylation in the absence of chiral ligand. A few examples of matched and mismatched double diastereoselection in the asymmetric dihydroxylation of chiral olefins have been reported and are summarized in the following paragraphs.

In his studies on the stereoselective synthesis of amino sugars, Wade ${ }^{82}$ investigated the asymmetric dihydroxylation of the 4,5-dihydroisoxazoles 144 and 145, shown in Table 1. The reactions employing the phthalazine class of ligands displayed useful levels of matched and mismatched diastereoselectivity (entries 6-9). Thus, in the mismatched reaction (entries 7 and 9), the reagent was able to strongly override the intrinsic diastereofacial bias of the olefin substrate.

| 9 | 145 | (DHQ) $2_{2}$-PHAL | cat. chiral ${ }^{\text {d }}$ | 5:95 | 85 |

${ }^{\text {a }} 0.1$ eq. of $\mathrm{OsO}_{4}, 3$ eq. NMO, THF/H $\mathrm{H}_{2} \mathrm{O}, 9: 1,20^{\circ} \mathrm{C}$. ${ }^{\mathrm{b}} 0.4$ eq. of chiral aux, ${ }^{\mathrm{c}} 3$ eq. of chiral aux, 1 eq. $\mathrm{OsO}_{4}$, $\mathrm{PhCH}_{3}, 20^{\circ} \mathrm{C}$. ${ }^{\mathrm{d}} 0.08$ eq. of $\mathrm{K}_{2} \mathrm{OsO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}, 3$ eq. $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}, 3$ eq. of $\mathrm{K}_{2} \mathrm{CO}_{3}, 0.4$ eq. of chiral aux, 1 eq. $\mathrm{MeSO}_{2} \mathrm{NH}_{2}, t-\mathrm{BuOH} / \mathrm{H}_{2} \mathrm{O}, 1: 1,20^{\circ} \mathrm{C}$. ${ }^{\mathrm{e}}$ Use of AD-mix- $\alpha$ under recommended conditions gave only $20 \%$ reaction after 22 h .

Morikawa and Sharpless ${ }^{83}$ carried out a similar set of experiments on carbohydrate-derived olefin 148 shown in Table 2. These experiments were performed to assess the relative ability of several different ligands in the context of matching and mismatching in the asymmetric dihydroxylation reaction. For this substrate, it was found that the phthalazine ligand (DHQD) $2^{-}$ PHAL was the ligand of choice for the matched reaction (entry 4). Whereas, inspite of their poor performance in the matched reactions, the pyrimidine derivatives $(\mathrm{DHQ})_{2}-\mathrm{PYR}$ and $(\mathrm{DHQ})_{2}$ $\operatorname{PYR}(\mathrm{OMe})_{3}$ gave the best results in the mismatched examples (entries 7 and 9).

Table 2.

| Entry | Ligand (mol\%) | Ratio (149:150) | Yield, \% |
| :---: | :--- | :---: | :---: |
| 1 | Quinuclidine (10) | $2.6: 1$ | $85 \%$ |
| 2 | DHQD-CLB (10) | $10: 1$ | $87 \%$ |
| 3 | DHQ-CLB (10) | $1: 10$ | $85 \%$ |

| 4 | $(\mathrm{DHQD})_{2}$-PHAL (1) | $39: 1$ | $84 \%$ |
| :---: | :--- | :--- | :--- |
| 5 | $(\mathrm{DHQ})_{2}-$ PHAL (1) | $1: 1.3$ | $52 \%$ |
| 6 | $(\mathrm{DHQD})_{2}$-PYR (5) | $6.9: 1$ | $90 \%$ |
| 7 | $(\mathrm{DHQ})_{2}-\mathrm{PYR} \mathrm{(5)}$ | $1: 4.1$ | $86 \%$ |
| 8 | $(\mathrm{DHQD})_{2}-\mathrm{PYR}(\mathrm{OMe})_{3}(5)$ | $12: 1$ | $89 \%$ |
| 9 | $(\mathrm{DHQ})_{2}-\mathrm{PYR}(\mathrm{OMe})_{3}(5)$ | $1: 7$ | $90 \%$ |

A mismatched double diastereoselective asymmetric dihydroxylation played a key role in the synthesis of polyhydroxylated indolizidine alkaloid castanospermine ${ }^{84}$ (Scheme 28). In the asymmetric dihydroxylation of epoxy ester 151, Cha ${ }^{84}$ observed 10:1 preference for the syn diastereomer 152 in reactions employing the $\left(\mathrm{DHQ}_{2}\right.$-PHAL ligand. A complete reversal of selectivity was observed in the matched case, as the anti product 153 was the major product with $>20: 1$ diastereoselectivity. The major product 152 from the mismatched reaction was subsequently converted into (+)-castanospermine in what is one of the most concise syntheses of this target to date.

151

152

153

(+)-castanospermine

Scheme 28

Several more examples of double diastereoselection in asymmetric dihydroxylation are reported in the literature. Among them are the synthesis of brassinosteroid analogs, ${ }^{85}$ synthesis of immunosuppressant FK-506, ${ }^{86}$ preparation of intermediates in the synthesis of mycalamide B, ${ }^{87}$ insect juvenile hormone bisepoxide, ${ }^{88}$ and the preparation of modified pyrimidine nucleobases. ${ }^{89}$

Corey et al. ${ }^{90}$ have carried out the stereocontrolled total syntheses of several vic-polyols through double diastereoselective asymmetric dihydroxylation. Olefin 154 with the $(\mathrm{DHQ})_{2}$ PHAL ligand in the matched case gave excellent diastereoselectivity in favor of anti product

155, while use of ( DHQD$)_{2}$ PYDZ ligand also resulted (mismatched case) in good diastereoselection in favor of syn product 156 (Table 3).

Table 3.

| Dihydroxylation conditions | Isolated Yield | Ratio of anti:syn |
| :--- | :--- | :---: |
| OsO $_{4}, \mathrm{NMO}$, Acetone- $\mathrm{H}_{2} \mathrm{O}(10: 1)$ | $88 \%$ of anti and syn | $1.9: 1$ |
| (DHQ) $)_{2}$-PHAL (matched case) | $86 \%$ of anti | $54: 1$ |
| (DHQD) ${ }_{2} \mathrm{PYDZ} \mathrm{(mismatched} \mathrm{case)}$ | $86 \%$ of syn | $1: 35$ |

Similarly, the asymmetric dihydroxylation of olefin 157 in the matched case with $\left(\mathrm{DHQ}_{2}\right)_{2}$ PHAL ligand gave excellent diastereoselectivity in favor of anti product 158, while the mismatched case with ( DHQD$)_{2}$-PHAL ligand favored the syn product 159 (Table 4).

Table 4.

| Dihydroxylation conditions | Isolated Yield | Ratio of anti:syn |
| :--- | :--- | :---: |
| $\mathrm{OsO}_{4}, \mathrm{NMO}$, Acetone- $\mathrm{H}_{2} \mathrm{O}(10: 1)$ | $96 \%$ of anti and syn | $2.5: 1$ |
| $(\mathrm{DHQ})_{2}$-PHAL (matched case) | $93 \%$ of anti | $200: 1$ |
| (DHQD) $)_{2} \mathrm{PYDZ} \mathrm{(mismatched} \mathrm{case)}$ | $90 \%$ of syn | $1: 90$ |

In our synthetic endeavors, after having achieved the synthesis of D -(+)-erythrodihydrosphingosine via the asymmetric dihydroxylation approach, we further ventured into the synthesis of another target molecule of this class of compounds called phytosphingosine. The concept of double diastereoselection in asymmetric dihydroxylation on a terminal olefin with pre-existing chirality was utilized for the synthesis. This section highlights our work on double diastereoselection and also its application towards the synthesis of four of the eight isomers of $\mathrm{C}_{18}$-phytosphingosine.

## Phytosphingosine

Phytosphingosine $\mathbf{1 6 0}$ exists abundantly as one of the molecular species of sphingolipids in microorganisms, plants and many mammalian tissues such as brain, hair, intestine, ${ }^{91}$ uterus, ${ }^{92}$ liver, ${ }^{93}$ skin, ${ }^{94}$ kidney ${ }^{95}$ and in blood plasma. ${ }^{96}$ It was first isolated from mushrooms in $1911^{97}$ and its structure was elucidated by Oda ${ }^{98 \mathrm{a}}$ and by Carter et al. ${ }^{98 \mathrm{~b}}$ In addition to its structural function as the long-chain base of sphingolipids in membranes, phytosphingosine itself is a bioactive lipid; for example, phytosphingosine 160 is a potential heat stress signal in yeast cells ${ }^{99 a, b}$ and some of its derivatives exhibit important physiological activities. $\alpha$ - and $\beta$ Galactosyl and glucosylphytoceramides possess very high tumor inhibitory potency. ${ }^{99 \mathrm{c}}$

Figure 9

Of the eight $\mathrm{C}_{18}$-phytosphingosine isomers (Figure 9) belonging to ribo-, arabino-, xylo-, and lyxo- series, most synthetic studies have been focused primarily on the preparation of ribo- or arabino-phytosphingosines, the stereochemistry of the C-2 position being either derived from the chiral pool materials, particularly serine, or by asymmetric synthesis. ${ }^{100}$ To our knowledge, only eight syntheses of lyxo- or xylo-phytosphingosines, either racemic ${ }^{101}$ or enantiomerically enriched, ${ }^{102}$ have been described to date.

Although sphingolipids are known 100 years ago, no report on the asymmetric synthesis of L xylo- $(2 R, 3 S, 4 S)-\mathrm{C}_{18}$-phytosphingosine 161 was known. In the present investigation, the first ever synthesis of this isomer and also the diastereoselective synthesis of $\mathrm{D}-x y l o-(2 S, 3 R, 4 R)-\mathrm{C}_{18}$, L -lyxo-( $2 S, 3 S, 4 S$ )- $\mathrm{C}_{18}$ and D-lyxo- $(2 R, 3 R, 4 R)-\mathrm{C}_{18}$-phytosphingosines have been achieved.

### 3.3.2. Review of Literature

Several syntheses of different isomers of phytosphingosine, predominantly in the ribo- and arabino-series have been documented. Most methods employ the chiral pool materials like carbohydrates and serine. A few interesting syntheses of phytosphingosine are described below.

## Schmidt et al. ${ }^{102 \mathrm{a}}$ (1988) Scheme 29

Schmidt et al. employed a Dthreose-based synthesis of Dribo and L-lyxo-phytosphingosine. Reaction of tetradecyl magnesium bromide with D-threose derivative 168 gave a separable 1:1 mixture of 169 and $\mathbf{1 7 0}$. Conversion of HO-2 to mesylate and subsequent azide displacement furnished 171 and 172 respectively. Deprotection of benzylidene and reduction of azide afforded D-ribo- and L-lyxo-phytosphingosines $\mathbf{1 6 0}$ and $\mathbf{1 6 3}$ respectively.

Scheme 29. Reaction conditions: (i) $\mathrm{C}_{14} \mathrm{H}_{29} \mathrm{MgBr}$, THF, $35 \%$ (169), $36 \%$ (170). (ii) (a) MsCl , pyridine, $-30^{\circ} \mathrm{C}, 12 \mathrm{~h}, 75 \%$, (b) $\mathrm{DMF}, \mathrm{NaN}_{3}, 90^{\circ} \mathrm{C}, 2 \mathrm{~d}, 63 \%$. (iii) (a) MeOH , conc. $\mathrm{HCl}, 15 \mathrm{~h}$, $65 \%$, (b) $\mathrm{LiAlH}_{4}, \mathrm{THF}, \mathrm{rt}, 30 \mathrm{~min}, 1 \mathrm{~h}$, reflux, $95 \%$.

## Dondoni et al. ${ }^{103}$ (1990) Scheme 30

In Dondoni's approach, reaction of 2-(trimethylsilyl)thiazole (2-TST) 173 with Garner aldehyde 28 gave 174 ( $95 \%$ ds). Benzylation of the hydroxyl group and one-pot unmasking afforded the aldehyde 175. Addition of 2-TST to aldehyde 175 furnished 176 in $85 \%$ ds. Protection of hydroxyl and unmasking gave aldehyde 177, which on Wittig reaction and subsequent reduction of the resultant olefin and concomitant debenzylation produced 178. Cleavage of acetonide and BOC deprotection afforded $\mathbf{1 6 0}$.

Scheme 30. Reaction conditions: (i) $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rt}, 20 \mathrm{~h}$, then $n$ - $\mathrm{Bu}_{4} \mathrm{NF}, 1 \mathrm{~h}, 85 \%$. ## Murakami et al. ${ }^{104}$ (1994) Scheme 31

Murakami et al. synthesized D-ribo-phytosphingosine from D-glucosamine by utilizing its whole carbon skeleton and functional groups. 4,6-O-Ethylidene-N-benzoyl-D-glucosamine 179 (readily prepared from D-glucosamine ${ }^{105}$ ) was reduced to give the triol. Selective protection of the primary hydroxyl and mesylation gave the dimesylate 180, which was further converted into phenyl oxazoline 181. Deprotection of acetal followed by base treatment gave the epoxide 183. Conversion of the free hydroxyl into tosylate and displacement with dodecyl magnesium bromide gave rise the epoxide 184, which was subjected to ring opening with iodide to furnish 185. Deiodination, hydrolysis of phenyloxazoline and TBDPS groups followed by acetylation afforded the tetraacetate derivative of D-ribo-phytosphingosine 187.

Scheme 31. Reaction conditions: (i) (a) $\mathrm{NaBH}_{4}, i-\mathrm{PrOH}, \mathrm{H}_{2} \mathrm{O}, 0^{\circ} \mathrm{C}, 1 \mathrm{~h}, 95 \%$, (b) $t-\mathrm{BuPh}_{2} \mathrm{Si}-\mathrm{Cl}$, pyridine, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rt}, 24 \mathrm{~h}$ then $\mathrm{MsCl}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 0^{\circ} \mathrm{C}, 2 \mathrm{~h}$. ## Kobayashi et al. ${ }^{106}$ (1994) Scheme 32

Kobayashi employed Lewis acid catalyzed asymmetric Aldol reaction of acrolein 188 with ketene silyl acetal 189 in presence of diamine 190 to give 191 (syn/anti $=98: 2,96 \%$ ee for $s y n$ ). Reduction of 191 and diol protection gave 192, which on epoxidation and subsequent alkylation with Grignard reagent furnished compound 194. The subsequent protection/deprotection of hydroxyl groups followed by its conversion into azide eventually led to the formation of compound 196. Removal of MOM and acetonide groups followed by azide reduction and subsequent acetylation gave the tetraacetate derivative of D-ribo-phytosphingosine 187.

Scheme 32. Reaction conditions: (i) $\mathrm{Sn}(\mathrm{OTf})_{2}, \mathrm{SnO}$, 190, propionitrile, 80\%. (ii) (a) DIBAL-H, (b) $p$-TsOH, 2,2 -DMP, $92 \%$. (iii) $m$-CPBA, $96 \%$ (74/26). ## Wu et al. ${ }^{102 c}$ (1995) Scheme 33

In Wu's approach, the reaction of 2,4-O-ethylidene-D-threose 197 (prepared from Dgalactose ${ }^{107}$ ) with prop-2-ynyl bromide/Zn gave 198 (erythro:threo, 11.7:1). Alkyne substitution, triflation of $2-\mathrm{OH}$ and azide displacement furnished 200. Deprotection of acetal and hydrogenation of azide and alkyne gave D-ribo-phytosphingosine 160. In order to synthesize L lyxo-phytosphingosine, 201 (prepared from D-xylose ${ }^{108}$ ) was first converted into the alkyne 202. Conversion of terminal acetonide into $t$-butyl ether gave 203. Mesylation of hydroxyl and azide displacement followed by alkyne substitution furnished 205. Deprotection of acetonide and hydrogenation afforded L-lyxo-phytosphingosine 163.

Scheme 33. Reaction conditions: (i) prop-2-ynyl bromide, $\mathrm{Zn}, \mathrm{DMF}^{2}-\mathrm{Et}_{2} \mathrm{O}$, $85 \%$. (ii) $n$ - BuLi , $\mathrm{C}_{11} \mathrm{H}_{23} \mathrm{Br}$, THF-HMPA, $74 \%$. ## Pedersen et al. ${ }^{109}$ (1996) Scheme 34

In Pedersen's approach, the syn,syn-diol 206 obtained by Pinacol coupling ${ }^{110}$ was converted into cyclic sulfate 207. Compound 207 on heating in $\mathrm{CH}_{3} \mathrm{CN}$ at reflux gave the cyclic carbonate 208. Removal of benzyl protection, saponification of carbonate and acetylation afforded the D -arabino-phytosphingosine tetraacetate 209.

Scheme 34. Reaction conditions: (i) (a) $\mathrm{SOCb}_{2}, \mathrm{Et}_{3} \mathrm{~N}$, (b) $\mathrm{RuCl}_{3}, \mathrm{NaIO}_{4}, 89 \%$. (ii) (a) $\mathrm{CH}_{3} \mathrm{CN}$, reflux, (b) THF, $2 \% \mathrm{H}_{2} \mathrm{SO}_{4}$. ## Yoda et al. ${ }^{111}$ (1996) Scheme 35

In Yoda's approach, the hydroxylactam $\mathbf{2 1 0}^{112}$ on successive TBDMS and BOC protection followed by unsaturation gave 212. Dihydroxylation and acetonide protection followed by treatment with tridecyl magnesium bromide and reduction afforded 214, which on deoxygenation via thioimidazolide led to compound 215. Deprotection of acetonide, BOC, TBDMS and subsequent acetylation gave D-ribo-phytosphingosine tetraacetate 187.

Scheme 35. Reaction conditions: (i) (a) $t$ - $\mathrm{BuMe}_{2} \mathrm{Si}-\mathrm{Cl}$, imidazole, $\mathrm{DMF}, 88 \%$, (b) $(\mathrm{BOC})_{2} \mathrm{O}$, $\mathrm{Et}_{3} \mathrm{~N}$, DMAP, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 90 \%$. ## Fujisawa et al. ${ }^{113}$ (1997) Scheme 36

Fujisawa carried out the diastereoselective addition of dithianide to Garner aldehyde 28 with high anti-diastereoselectivity to give 216. Protection of hydroxyl and selective dithiane hydrolysis furnished the aldehyde 135. Dodecylacetylide 217 addition to aldehyde 135 at lower temperature gave 218 in high anti-diastereoselectivity ( $95 \%$ de). Hydrogenation of $\mathbf{2 1 8}$ followed by deprotection of acetonide and BOC groups eventually led to D-ribo-phytosphingosine $\mathbf{1 6 0}$.

Scheme 36. Reaction conditions: (i) Li-dithianide, $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}, \mathrm{CuI},-50^{\circ} \mathrm{C}-\mathrm{rt}, \mathrm{THF}, 70 \%$. (ii) (a) KHMDS, $\mathrm{BnBr}, 92 \%$, (b) NBS, $67 \%$. (iii) $217,-110^{\circ} \mathrm{C}$ to rt, THF. ## Horikawa et al. ${ }^{114}$ (1998) Scheme 37

Horikawa carried out diastereoselective dihydroxylation on olefin 220 derived from Garner aldehyde 28. When AD-mix- $\alpha$ was used in dihydroxylation, compound 221 was obtained in $83 \%$ ds; while use of AD-mix- $\beta$ gave compound 222 in $83 \%$ ds. These two compounds on subsequent removal of BOC protecting group furnished D-arabino and D-ribo-phytosphingosines 167 and 160 respectively in quantitative yield.

Scheme 37. Reaction conditions: $\mathrm{C}_{14} \mathrm{H}_{29} \mathrm{CH}=\mathrm{PPh}_{3}, 71 \%$. (ii) Amberlite IR-120, $93 \%$. (iii) $\mathrm{AD}-$ mix- $\alpha$ or $\mathrm{AD}-$ mix- $\beta$, $86-89 \%$. (iv) (a) $\mathrm{CF}_{3} \mathrm{CO}_{2} \mathrm{H}$, (b) aq. $\mathrm{NaHCO}_{3}, 96-100 \%$.

## Suryawanshi et al. ${ }^{115}$ (1998) Scheme 38

Suryawanshi et al. employed diacetone mannose 224 in Wittig reaction to give the olefin 225. Triflation of hydroxyl and azide displacement gave 226, which on reduction followed by acylation furnished the palmitate 227. Deprotection of terminal acetonide and periodic oxidation followed by reduction gave the alcohol 228, which on subsequent deprotection of acetonide group led to D-ribo-ceramide 229.

Scheme 38. Reaction conditions: (i) Acetone, $\mathrm{H}^{+}$. (ii) $\mathrm{C}_{12} \mathrm{H}_{25} \mathrm{P}^{+} \mathrm{Ph}_{3} \mathrm{Br}^{-}, t$ - $\mathrm{BuOK}, \mathrm{PhCH}_{3}, 80 \%$. (iii) (a) $\mathrm{Tf}_{2} \mathrm{O}$, pyridine, (b) $\mathrm{NaN}_{3}, \mathrm{DMF}, 80 \%$. (iv) (a) $10 \% \mathrm{Pd}-\mathrm{C}, \mathrm{H}_{2}, \mathrm{EtOAc}, 65 \%$, (b) $\mathrm{C}_{15} \mathrm{H}_{31} \mathrm{CO}_{2} \mathrm{C}_{6} \mathrm{H}_{4} p \mathrm{NO} 2$, pyridine, $100 \%$. (v) (a) $\mathrm{H}_{5} \mathrm{IO}_{6}$, EtOAc , (b) $\mathrm{NaBH}_{4}, \mathrm{EtOH}, 60 \%$. (vi) $70 \%$ $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}, 100 \%$.

## Martin et al. ${ }^{116}$ (2000) Scheme 39

Martin et al. employed the lactol $\mathbf{2 3 0}^{117}$ in Grignard reaction to give the diol $\mathbf{2 3 1}$ in $\mathbf{9 0 \%}$ de. Primary hydroxyl protection and retro Diels-Alder reaction gave ( $Z$ )-allylic alcohol 233, which
on reaction with trichloroacetonitrile in presence of DBU gave the unstable trichloroacetamide 234. The subsequent thermal rearrangement afforded $(E)$-allylic trichloroacetamide 235, which on asymmetric dihydroxylation with AD-mix- $\beta$ gave 236 in $94 \%$ de. Deprotection of TBDPS and hydrolysis of trichloroacetamide, followed by acetylation eventually led to D-lyxophytosphingosine tetraacetate 238.

Scheme 39. Reaction conditions: (i) $\mathrm{C}_{14} \mathrm{H}_{29} \mathrm{MgBr}$, THF, $80 \%$. (ii) $t$ - $\mathrm{BuMe}_{2} \mathrm{Si}-\mathrm{Cl}$, imidazole, DMF, $70 \%$. (iii) Microwaves, $100 \%$. (iv) $\mathrm{CCl}_{3} \mathrm{CN}, \mathrm{DBU}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$. (v) xylenes, $140^{\circ} \mathrm{C}, 7 \mathrm{~h}, 81 \%$ from 223. (vi) AD -mix- $\beta$, $1 \% \mathrm{~K}_{2} \mathrm{OsO}_{2}(\mathrm{OH})_{4}, \mathrm{CH}_{3} \mathrm{SO}_{2} \mathrm{NH}_{2}, \mathrm{H}_{2} \mathrm{O} / t-\mathrm{BuOH}, 4 \mathrm{~h}, 80 \%$. (vii) (a) $n$ $\mathrm{Bu}_{4} \mathrm{NF}$, THF, 4 h , (b) $\mathrm{NaOH}, \underset{\sim}{\mathrm{O}} / \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}, 100^{\circ} \mathrm{C}, 16 \mathrm{~h}, 67 \%$. (viii) $\mathrm{Ac}_{2} \mathrm{O}$, pyridine, DMAP, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 6 \mathrm{~h}, 74 \%$.

## Bittman et al. ${ }^{118}$ (2000) Scheme 40

In Bittman's approach, asymmetric dihydroxylation and cyclic sulfate methodology was employed in the synthesis of 187. Asymmetric dihydroxylation of terminal olefin 239 gave the diol 240. Selective conversion of secondary hydroxyl into MOM ether via orthoacetate and DIBAL-H cleavage furnished 241. Oxidation of alcohol 241 and Wittig reaction gave the olefin 242 that was subjected to a second asymmetric dihydroxylation to furnish the diol $\mathbf{2 4 3}$ in $91 \%$ de. The diol was converted into the cyclic sulfate 244 , which on opening with azide gave 245 . Removal of MOM protection, reduction of azide and ester followed by acetylation furnished D ribo-phytosphingosine tetraacetate 187.

Scheme 40. Reaction conditions: (i) AD-mix- $\beta, t$ - $\mathrm{BuOH}, \mathrm{H}_{2} \mathrm{O}, 0^{\circ} \mathrm{C}, 95 \%$. (ii) $\mathrm{CH}(\mathrm{OMe})_{3}$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, D-10-camphor sulfonic acid, rt, then DIBAL-H, $-78^{\circ} \mathrm{C}, 96 \%$, (iii) (a) $(\mathrm{COCl})_{2}, \mathrm{DMSO}$, $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-78^{\circ} \mathrm{C}$ to $-46^{\circ} \mathrm{C}$, (b) $(i-\mathrm{PrO})_{2} \mathrm{POCH}_{2} \mathrm{CO}_{2} \mathrm{Et}, \mathrm{LiBr}, \mathrm{Et}_{3} \mathrm{~N}$, THF, rt, $86 \%$. ### 3.3.3. Present Work

## Objective:

Given the vast chemistry, structural modifications and biological activities associated with the sphingolipids, the synthesis of this class of vicinal amino alcohols has aroused considerable interest among several research groups round the world. Although a few syntheses are reviewed above, several more are documented in the literature. This explains the importance of research work in sphingolipid chemistry. With the completion of synthesis of D-(+)-erythrodihydrosphingosine ${ }^{80}$ through asymmetric dihydroxylation coupled with the chemistry of cyclic sulfites/sulfates and cyclic benzylidene, our attention was further focused to extrapolate the above knowledge to the enantioselective total synthesis of $\mathrm{C}_{18}$-phytosphingosines. Most syntheses in $\mathrm{C}_{8}$-phytosphingosines are in the arabino- and ribo- series and only a few syntheses of lyxo- and xylo- isomers are known.

161 L-xylo [2R,3S,4S]

162 D-xylo $[2 S, 3 R, 4 R$ ]

163 L-lyxo [2S,3S,4S]

164 D-lyxo [2R,3R,4R]

Figure 10
The lyxo- and xylo-isomers have the syn-placement of 3,4-hydroxyl groups (Figure 10). We envisaged therefore fixing these chiral centers first by asymmetric dihydroxylation. With a view to investigate the double diastereoselection in asymmetric dihydroxylation of chiral olefins, i.e. the influence of substrate chirality and the ligand induction, we synthesized the terminal olefins 252 and 253. As it is well known that in the matched case, a good diastereoselection would result, we planned to elaborate the corresponding diol products from $\mathbf{2 5 2}$ and $\mathbf{2 5 3}$ towards the syntheses of xylo- and lyxo-isomers of $\mathrm{C}_{18}$-phytosphingosines.

Thus, the objective of the present investigation is to study the double diastereoselection in asymmetric dihydroxylation and syntheses of xylo- and lyxo- $\mathrm{C}_{18}$-phytosphingosines. In the present work we have undertaken the first synthesis of L -xylo- $\mathrm{C}_{18}$-phytosphingosine. So far there has been no report of its synthesis in the literature.

### 3.3.4. Results and Discussion

With a view to explore the concept of double diastereoselection, we prepared the enantiomerically enriched terminal olefins 252 and $\mathbf{2 5 3}$ following the reaction steps as shown in Scheme 42. The commercially available pentadecanol 254 was oxidized to the aldehyde and subsequently treated with (ethoxycarbonylmethylene)triphenylphosphorane to give the Wittig product 255. The IR spectrum of 255 gave carbonyl absorption at $1717 \mathrm{~cm}^{-1}$ and $\mathrm{C}=\mathrm{C}$ stretching at $1653 \mathrm{~cm}^{-1}$. The ${ }^{1} \mathrm{H}$ NMR spectrum gave olefin peaks at $\delta 5.8$ (doublet of triplet) and 6.97 (doublet of triplet) with the coupling constant $J=16 \mathrm{~Hz}$ indicating trans-olefin. The asymmetric dihydroxylation of olefin 255 using $\left(\mathrm{DHQ}_{2}\right.$-PHAL ligand under the Sharpless asymmetric dihydroxylation conditions gave the diol 256 in $94 \%$ yield and $99 \%$ ee. ${ }^{121 a}$ In the IR spectrum, the olefin absorption was absent and hydroxyl absorption appeared at $3372 \mathrm{~cm}^{-1}$. The ${ }^{1} \mathrm{H}$ NMR spectrum showed chiral protons at $\delta 3.86$ (multiplet) and 4.06 (multiplet). The corresponding chiral carbons appeared at $\delta 72.52$ and 73.32 in the ${ }^{13} \mathrm{C}$ NMR spectrum. Protection of the diol 256 with 2,2-dimethoxypropane and catalytic $p$-TsOH gave the acetonide ester 257 in $98 \%$ yield. The IR spectrum of 257 indicated absence of hydroxyl groups. The acetonide methyl protons appeared at $\delta 1.43$ (singlet) and 1.46 (singlet) in the ${ }^{1} \mathrm{H}$ NMR spectrum and the typical quaternary carbon of acetonide appeared at $\delta 110.82$ in the ${ }^{13} \mathrm{C}$ NMR spectrum. The reduction of ester group in $\mathbf{2 5 6}$ with lithium aluminium hydride gave alcohol $\mathbf{2 5 8}$ in excellent yield. The IR spectrum of $\mathbf{2 5 8}$ gave hydroxyl absorption at $3440 \mathrm{~cm}^{-1}$ and the ester carbonyl group was absent. The primary alcohol was oxidized to the aldehyde under the normal Swern oxidation conditions. Subsequent Wittig reaction with ylide generated from methyltriphenylphosphoniumiodide and NaHMDS furnished the olefin 252 in $77 \%$ yield. The IR spectrum of $\mathbf{2 5 2}$ showed absence of hydroxyl absorption. The ${ }^{1} \mathrm{H}$ NMR spectrum of 252 gave olefin peaks at $\delta$ 5.2-5.4 (multiplet, two protons) and 5.7-5.9 (multiplet, one proton). Similarly the enantiomer of 252 i.e., 253 was prepared from 255 via $\beta$-dihydroxylation using ( DHQD$)_{2}$-PHAL and following the reaction sequence as shown in Scheme 42.

In the SAD of olefins, the stereochemical outcome of the reaction may be influenced by the presence of pre-existing chirality in the substrate. In double diastereoselective SAD reactions of chiral olefins, the level of diastereoselectivity in both the matched and mismatched reactions varies with the chiral ligands.

256

258

252

259

253
255

Scheme 42. Reaction conditions: (i) (a) $\mathrm{P}_{2} \mathrm{O}_{5}, \mathrm{DMSO}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{Et}_{3} \mathrm{~N}, 0^{\circ} \mathrm{C}$, (b) $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{CHCO}_{2} \mathrm{Et}$, THF, reflux, $12 \mathrm{~h}, 90 \%$. (ii) $\left(\mathrm{DHQ}_{2}\right.$ - $\mathrm{PHAL}, \mathrm{OsO}_{4}, \mathrm{MeSO}_{2} \mathrm{NH}_{2}, \mathrm{~K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}, \mathrm{~K}_{2} \mathrm{CO}_{3}, t$ $\mathrm{BuOH}: \mathrm{H}_{2} \mathrm{O}$ [1:1], $24 \mathrm{~h}, 0^{\circ} \mathrm{C}, 94 \%$. (iii) (DHQD) $)_{2}-\mathrm{PHAL}, \mathrm{OsO}_{4}, \mathrm{MeSO}_{2} \mathrm{NH}_{2}, \mathrm{~K} 3 \mathrm{Fe}(\mathrm{CN})_{6}, \mathrm{~K}_{2} \mathrm{CO}_{3}$, $t$ - $\mathrm{BuOH}: \mathrm{H}_{2} \mathrm{O}$ [1:1], $24 \mathrm{~h}, 0 \circ \mathrm{C}, 94 \%$. (iv) 2,2-DMP, $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CO}, p-\mathrm{TsOH}$, rt, overnight, 98\%. (v) $\mathrm{LiAlH}_{4}, \mathrm{Et}_{2} \mathrm{O}, 0^{\circ} \mathrm{C}$ to 1 t , overnight, $93 \%$. (vi) (a) $(\mathrm{COCl})_{2}, \mathrm{DMSO}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{Et}_{3} \mathrm{~N},-78^{\circ} \mathrm{C}$, (b) $\mathrm{Ph}_{3} \mathrm{P}^{+} \mathrm{CH}_{3} \mathrm{I}^{-}, \mathrm{NaHMDS}, \mathrm{THF}, 0^{\circ} \mathrm{C}$ to rt, $12 \mathrm{~h}, 77 \%$.

Having obtained the enantiomerically enriched terminal olefins 252 and 253, we subjected them to the Sharpless asymmetric dihydroxylation reaction by varying the ligands employed. The results of double diastereoselection are given in Table 5.

252
Ligand, $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}, \mathrm{~K}_{2} \mathrm{CO}_{3}$,

$\downarrow \begin{gathered}\mathrm{OsO}_{4}, t-\mathrm{BuOH}-\mathrm{H}_{2} \mathrm{O}[1: 1], \\ 0^{\circ} \mathrm{C}, 24 \mathrm{~h}\end{gathered}$
$\downarrow \begin{gathered}\mathrm{OsO}_{4}, t-\mathrm{BuOH}_{-}-\mathrm{H}_{2} \mathrm{O}[1: 1], \\ 0^{\circ} \mathrm{C}, 24 \mathrm{~h}\end{gathered}$

264

265

Table 5. Double diastereoselection in SAD reaction of $\mathbf{2 5 2}$ and 253. ${ }^{121 \mathrm{~b}}$

| Olefin | Ligand | $\mathbf{2 6 2}$ | $\mathbf{2 6 3}$ | $\mathbf{2 6 4}$ | $\mathbf{2 6 5}$ | Yield\% | $\left.\begin{array}{l}\text { Diastereomeric Mixture } \\ {[\alpha]_{\mathrm{D}}^{20}(\mathrm{c}=1, \mathrm{CHCl}}\end{array}\right)$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |$|$

Thus, when the olefin 252 was subjected to the Sharpless asymmetric dihydroxylation using $(\mathrm{DHQ})_{2}$-PHAL ligand, the diastereomers 262 and 263 were obtained in 1:2 ratio, whereas a considerable enhancement in the diastereomeric ratio of $262: 263$ (5:1) was observed with the use of (DHQD) $)_{2}$-PHAL ligand (Table 1). The poor diastereoselectivity observed in the former case may be because of opposite influences of the chiral reagent and substrate (mismatched case) while the latter could be regarded as matched case where the chirality information of the reagent
and the substrate probably act synergistically and therefore, a high degree of diastereoselection was obtained. The use of $(\mathrm{DHQD})_{2}-\mathrm{AQN}$ ligand showing a marginal improvement in the diastereomeric ratio of $\mathbf{2 6 2 : 2 6 3}$ (6:1) could be regarded as another example of matched case (Table 5). Similar results were obtained with olefin 253 giving diastereomers 264 and 265 in 5.45:1 ratio with the use of $\left(\mathrm{DHQ}_{2} \text {-PHAL ligand and in } 1: 2 \text { ratio with (DHQD) }\right)_{2}$-PHAL ligand (Table 5). Interestingly, when the olefin 253 was subjected to the Sharpless asymmetric dihydroxylation reaction conditions using pyridine instead of cinchona alkaloid as ligand, the diastereomers 264 and 265 were obtained in 4.3:1 ratio showing relatively a good diastereoselection (Table 5). This could be explained on the basis of the chirality present in the substrate, which has significant influence on diastereoselection and the stereochemical course of the reaction. It may be pertinent to mention here that although a few examples of matched and mismatched double diastereoselection in the SAD of chiral olefins have been reported, the levels of diastereoselection observed in the SAD of chiral monosubstituted olefin are not as high as those observed for the other olefin substitution classes. ${ }^{122}$

Further, we extended the above results towards the synthesis of $\mathrm{L}-x y l o-(2 R, 3 S, 4 S)-\mathrm{C}_{18^{-}}$, D -xylo- $(2 S, 3 R, 4 R)-\mathrm{C}_{18^{-}}$, L-lyxo- $(2 S, 3 S, 4 S)-\mathrm{C}_{18^{-}}$, and $\mathrm{D}-$ lyxo- $(2 R, 3 R, 4 R)-\mathrm{C}_{18}$-phytosphingosines. The diastereomeric mixture of $\mathbf{2 6 2 : 2 6 3}$ in $6: 1$ ratio was separated by flash column chromatography on a TLC mesh silica gel ${ }^{123}$ to give 262 in diastereomerically pure form in $69 \%$ yield. The pure diastereomer 262 was converted into $\mathrm{L}-x y l o-(2 R, 3 S, 4 S)-\mathrm{C}_{18}$-phytosphingosine 161 as its tetraacetate derivative 274 as shown in Scheme 43.

Compound 262 had $[\alpha]_{D}{ }^{20}-20.1\left(c=1, \mathrm{CHCl}_{3}\right)$. The IR spectrum of 262 gave broad hydroxyl absorption at $3358-3250 \mathrm{~cm}^{-1}$. The hydroxyl protons appeared at $\delta 2.62$ (broad singlet) and the chiral protons at $\delta 3.55-3.76$ (multiplet, two protons) and 3.8-4.0 (multiplet, one proton) in the ${ }^{1} \mathrm{H}$ NMR spectrum. Protection of the primary hydroxyl group of 262 was carried out using pivaloyl chloride and pyridine at $O^{\circ} \mathrm{C}$ to give 271. The pivaloate carbonyl appeared at $1725 \mathrm{~cm}^{-1}$ in the IR spectrum of 271 and the $t$-butyl protons appeared at $\delta 1.23$ (singlet, 9 protons) in the ${ }^{1} \mathrm{H}$ NMR spectrum. The carbonyl carbon appeared at $\delta 178.67$ in the ${ }^{13} \mathrm{C}$ NMR spectrum. The C-2 hydroxyl was then converted into the azido functionality through mesylation with methanesulfonyl chloride, pyridine and catalytic DMAP, followed by the nucleophilic displacement with $\mathrm{LiN}_{3}$ to give 272 in $88 \%$ yield, with inversion of configuration at $\mathrm{C}-2$. The IR spectrum of 272 gave prominent azide absorption at $2116 \mathrm{~cm}^{-1}$. The protection of the primary

Scheme 43. Reaction conditions: (i) Pivaloyl chloride, pyridine, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 0^{\circ} \mathrm{C}$ to rt , overnight. (ii) (a) $\mathrm{MeSO}_{2} \mathrm{Cl}$, pyridine, DMAP (cat), $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 60^{\circ} \mathrm{C}$, overnight, (b) $\mathrm{LiN}_{3}, \mathrm{DMF}, 80^{\circ} \mathrm{C}, 12 \mathrm{~h}$. (iii) $\mathrm{LiAlH}_{4}, \mathrm{Et}_{2} \mathrm{O}, 0^{\circ} \mathrm{C}$ to rt , overnight. (iv) (a) $6 \mathrm{~N} \mathrm{HCl}, \mathrm{MeOH}$, rt, overnight, (b) $\mathrm{Ac}_{2} \mathrm{O}$, pyridine, DMAP (cat), $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rt}, 12 \mathrm{~h}$.
hydroxyl group as a pivaloate was advantageous over other protecting groups since both pivaloate deprotection and azide reduction could be accomplished together under the same conditions. Thus, the lithium aluminium hydride reduction of 272 gave the amino alcohol 273 in
excellent yield of $96 \%$. The IR spectrum of 273 gave hydroxyl and amine absorptions at 3370 and $3357 \mathrm{~cm}^{-1}$ and absence of pivaloate carbonyl. In an attempt to obtain amino alcohol 273 by an alternative approach, the terminal olefin 252 was subjected to the Sharpless asymmetric aminohydroxylation reaction using $(\mathrm{DHQD})_{2}$-PHAL ligand. However, it gave a complex mixture of compounds, which could not be isolated. Deprotection of the acetonide in 273 was effected with 6 N HCl in MeOH to give the hydrochloride salt of (2R,3S,4S)-2-amino-1,3,4trihydroxyoctadecane. This was subsequently acetylated using $\mathrm{Ac}_{2} \mathrm{O}$, pyridine and catalytic amount of DMAP to give the tetraacetate 274 of $\mathrm{L}-x y l o-(2 R, 3 S, 4 S)-\mathrm{C}_{18}$-phytosphingosine $\mathbf{1 6 1}$ in diastereomerically pure form (Figure 11A), having $[\alpha]_{D}{ }^{20}-7.2\left(c=1.2, \mathrm{CHCl}_{3}\right)\left[\right.$ lit $[\alpha]_{D}{ }^{21}+7.0$ $\left(\mathrm{c}=0.86, \mathrm{CHCl}_{3}\right)^{124}$ for enantiomer of 274]. The IR spectrum of 274 gave amine absorption at $3297-3290 \mathrm{~cm}^{-1}$, acetyl carbonyls at $1744 \mathrm{~cm}^{-1}$ and amide carbonyl at $1662 \mathrm{~cm}^{-1}$. The ${ }^{1} \mathrm{H}$ NMR spectrum of 274 gave acetyl methyl protons at $\delta 2.03$ (singlet, one methyl), 2.04 (singlet, two methyl) and 2.07 (singlet, one methyl), the chiral protons at $\delta 4.5$ (multiplet, one proton), 5.025.18 (multiplet, two potons) and the amide proton at $\delta 5.92$ (doublet with $J=10 \mathrm{~Hz}$ ). The ${ }^{13} \mathrm{C}$ NMR spectrum gave the chiral carbons at $\delta 48.00,71.26$ and 71.93 and four carbonyl carbons at $\delta 169.45,169.52,169.78,169.85$. The EIMS of 274 gave $\left[\mathrm{M}^{+}\right]$peak at $m / z 486$ and other characteristic peaks at 292, 144 and 84.

Following the similar reaction sequence, the diastereomeric mixture 268 was converted into the tetraacetate 278 of D-xylo- $(2 S, 3 R, 4 R)-\mathrm{C}_{18}$-phytosphingosine 162 (69\% de, Scheme 43). Pure diastereomer 278 was further separated from the mixture by column chromatography on TLC mesh silica gel ${ }^{123}$ (Figure 11C). Similarly diastereomeric mixture 266 was converted into the tetraacetate 282 of L-lyxo- $(2 S, 3 S, 4 S)$ - $\mathrm{C}_{18}$-phytosphingosine $\mathbf{1 6 3}$ ( $33 \%$ de) and $\mathbf{2 6 9}$ into the tetraacetate $\mathbf{2 8 6}$ of D-lyxo-( $2 R, 3 R, 4 R$ )-C 18 -phytosphingosine 164 (33\% de, Scheme 44).

### 3.3.5. Conclusion

We have exploited the concept of double diastereoselection in Sharpless asymmetric dihydroxylation reaction and applied the results obtained toward the diastereoselective synthesis of four of the eight isomers of $\mathrm{C}_{18}$-phytosphingosine. ${ }^{125}$ The diastereomeric mixture obtained could be separated by TLC mesh silica gel column chromatography. Thus, the L-xylo$(2 R, 3 S, 4 S)-\mathrm{C}_{18^{-}}$and D -xylo- $(2 S, 3 R, 4 R)-\mathrm{C}_{18}$-phytosphingosines were synthesized in diastereomerically pure form. The synthetic strategy employed can be further extended toward the synthesis of the arabino- and ribo- isomers by employing the cis-olefin for step (ii and iii) in Scheme 42. Thus, the diastereoselective synthesis of all the eight isomers of $\mathrm{C}_{18}{ }^{-}$ phytosphingosine can be achieved through a single synthetic strategy.

### 3.3.6. Experimental Section

## General information

Solvents were purified and dried by standard procedures before use. Petroleum ether of boiling range $60-80^{\circ} \mathrm{C}$ was used. Melting points are uncorrected. Optical rotations were measured using sodium D line on a JASCO P-1020 microprocessor based polarimeter. Infrared spectra were recorded on ATI MATTSON RS-1 FT-IR spectrometer. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Bruker AC-200 spectrometer. In the ${ }^{13} \mathrm{C}$ NMR data, peaks of only the major diastereomer (in case of a mixture) are given. Mass spectra were obtained with a TSQ 70, Finningen MAT mass spectrometer. Elemental analyses were carried out on a Carlo Erba CHNSO analyzer.

## Synthesis of ethyl trans-heptadec-2-enoate, 255

A two-necked round bottom flask was charged with pentadecanol 254 ( $8 \mathrm{~g}, 35 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(200 \mathrm{~mL})$ under nitrogen and then ice cooled. DMSO ( $5 \mathrm{~mL}, 70.42 \mathrm{mmol}$ ) and $\mathrm{P}_{2} \mathrm{O}_{5}(10$ $\mathrm{g}, 70.42 \mathrm{mmol}$ ) were added sequentially. The reaction mixture was stirred and allowed to warm to room temperature until the TLC showed complete disappearance of the starting material ( 45 $\mathrm{min})$. The flask was cooled to $0^{\circ} \mathrm{C}$ and $\mathrm{Et}_{3} \mathrm{~N}(17 \mathrm{~mL})$ was added dropwise over one minute. Stirring was continued for 45 min in ice bath and another 45 min at room temperature. The reaction mixture was quenched with $10 \%$ aq. $\mathrm{HCl}(150 \mathrm{~mL})$ and the solution extracted with EtOAc $(3 \times 50 \mathrm{~mL})$. The combined organic extracts were washed with brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuum to give pentadecanal as pale yellow oil, which was used in the next step without further purification.

To a solution of (ethoxycarbonylmethylene)triphenylphosphorane ( $14 \mathrm{~g}, 40.33 \mathrm{mmol}$ ) in dry THF ( 100 mL ) was added dropwise a solution of pentadecanal in THF ( 10 mL ) at room temperature. The reaction mixture was refluxed for 12 h . The solvent was removed under reduced pressure and the crude product was purified on a silica gel column using petroleum ether:EtOAc (9:1) as eluent to give $\mathbf{2 5 5}(9.34 \mathrm{~g})$ as a colorless oil.
Yield: $9.34 \mathrm{~g}, 90 \%$

## Synthesis of (3S,4S)-3,4-O-isopropylideneoctadec-1-ene-3,4-diol, 252

To a solution of oxalyl chloride ( $1.74 \mathrm{~g}, 1.2 \mathrm{~mL}, 13.7 \mathrm{mmol}$ ) in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(75 \mathrm{~mL})$ cooled at $-78^{\circ} \mathrm{C}$ was added dropwise DMSO ( $1.95 \mathrm{~mL}, 27.4 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ over 20 min . The reaction mixture was stirred for 30 min at $-78^{\circ} \mathrm{C}$ and the solution of alcohol $\mathbf{2 5 8}(3 \mathrm{~g}, 9.13$ $\mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ was added dropwise at $-60^{\circ} \mathrm{C}$ over 20 min . The reaction mixture was stirred for 30 min when a copious white precipitate was obtained. $\mathrm{Et}_{3} \mathrm{~N}(5.8 \mathrm{~mL}, 41 \mathrm{mmol})$ was added dropwise and stirred for 1 h allowing the temperature to rise to room temperature. The reaction mixture was quenched with $5 \%$ aq. $\mathrm{HCl}(100 \mathrm{~mL})$ and the new phase extracted with EtOAc. The combined organic phases were washed (brine), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated to give the crude aldehyde, which was used in the next step without further purification.

To a suspension of methyltriphenylphosphoniumiodide ( $5 \mathrm{~g}, 12.37 \mathrm{mmol}$ ) in dry THF ( 10 mL ) was added NaHMDS ( $14 \mathrm{~mL}, 14 \mathrm{mmol}, 1 \mathrm{M}$ in THF ) and stirred overnight at room
temperature. The precipitated solids were allowed to settle and the supernatant liquid was added through a syringe to the solution of the aldehyde in dry THF ( 15 mL ). The reaction mixture was stirred at room temperature for 18 h and then quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}$. The aqueous layer was extracted with EtOAc $(3 \times 30 \mathrm{~mL})$. The combined organic extracts were washed (brine), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. Purification of the residue by silica gel column chromatography using petroleum ether:EtOAc (24:1) gave $252(2.28 \mathrm{~g})$ as a pale yellow oil.
Yield: $2.28 \mathrm{~g}, 77 \%$

## General procedure for asymmetric dihydroxylation of olefins 252 and 253

To a mixture of $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}(7.6 \mathrm{~g}, 23.1 \mathrm{mmol}), \mathrm{K}_{2} \mathrm{CO}_{3}(3.2 \mathrm{~g}, 23.1 \mathrm{mmol})$ and the ligand (72 $\mathrm{mg}, 92.4 \mu \mathrm{~mol}, 1.2 \mathrm{~mol} \%)$ in $t-\mathrm{BuOH}-\mathrm{H}_{2} \mathrm{O}(1: 1,90 \mathrm{~mL})$ cooled at $0^{\circ} \mathrm{C}$ was added osmium tetroxide ( $468 \mu \mathrm{~L}, 0.1 \mathrm{M}$ solution in toluene, $0.6 \mathrm{~mol} \%$ ). After stirring for 5 min at $0^{\circ} \mathrm{C}$, the olefin 252 or 253 ( $2.5 \mathrm{~g}, 7.7 \mathrm{mmol}$ ) was added in one portion. The reaction mixture was stirred at $0^{\circ} \mathrm{C}$ for 24 h and then quenched with solid sodium sulfite ( 3 g ). The stirring was continued for an additional 45 min and then the solution was extracted with EtOAc $(5 \times 30 \mathrm{~mL})$. The combined organic phases were washed (brine), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. Silica gel column chromatography of the crude product using petroleum ether:acetone (7:3) as eluent gave the diols (266-269) as white solids in $89-93 \%$ yields.

## Compound 266

M.p.: $53-55^{\circ} \mathrm{C}$
$[\alpha]_{\underline{D}}^{\mathbf{2 0}}:-17.3\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$
IR ( $\left.\mathbf{C H C l}_{3}, \mathbf{c m}^{-1}\right): v_{\max } 3420-3300,2923,1465,1378,1245,861,487$

## Synthesis of compound 262

To a mixture of $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}(3.043 \mathrm{~g}, 9.24 \mathrm{mmol}), \mathrm{K}_{2} \mathrm{CO}_{3}(1.28 \mathrm{~g}, 9.24 \mathrm{mmol})$ and (DHQD) $2_{2}$ AQN ( $40 \mathrm{mg}, 46.6 \mu \mathrm{~mol}, 1.5 \mathrm{~mol} \%$ ) in $t-\mathrm{BuOH}-\mathrm{H}_{2} \mathrm{O}(1: 1,40 \mathrm{~mL})$ cooled at $0^{\circ} \mathrm{C}$ was added osmium tetroxide ( $250 \mu \mathrm{~L}, 0.1 \mathrm{M}$ solution in toluene, $0.8 \mathrm{~mol} \%$ ). After stirring for 5 min at $0^{\circ} \mathrm{C}$, the olefin $252(1 \mathrm{~g}, 3.08 \mathrm{mmol})$ was added in one portion. The reaction mixture was stirred at $0^{\circ} \mathrm{C}$ for 24 h and then quenched with solid sodium sulfite $(2 \mathrm{~g})$. The stirring was continued for an additional 45 min and then the solution was extracted with EtOAc $(5 \times 30 \mathrm{~mL})$. The combined organic phases were washed (brine), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. Silica gel column chromatography of the crude product using petroleum ether:EtOAc (7:3) as eluent gave a diastereomeric mixture of 262 and 263 ( 1.016 g , 92\%) in 6:1 ratio. Diastereomereric mixture 262
and 263 was separated by flash column chromatography on TLC mesh silica gel using petroleum ether: $\operatorname{EtOAc}(7: 3)$ as eluent to give $262(0.763 \mathrm{~g})$ as a white solid.

Yield: $0.763 \mathrm{~g}, 69 \%$
M.p.: $54-56^{\circ} \mathrm{C}$
$[\alpha]_{D}{ }^{\mathbf{2 0}} \boldsymbol{i}-20.1\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$
IR ( $\left.\mathbf{C H C l}_{3}, \mathbf{c m}^{-1}\right): v_{\max } 3358-3250,2924,1465,1382,1220,760,479$
${ }^{1} \mathbf{H}$ NMR ( $200 \mathbf{~ M H z}, \mathbf{C D C l}_{3}$ ): $\delta 0.88(\mathrm{t}, J=6 \mathrm{~Hz}, 3 \mathrm{H}), 1.23-1.3(\mathrm{~m}, 24 \mathrm{H}), 1.38(\mathrm{~s}, 3 \mathrm{H}), 1.40(\mathrm{~s}$, $3 \mathrm{H}), 1.53(\mathrm{~m}, 2 \mathrm{H}), 2.62(\mathrm{brs}, 2 \mathrm{H}), 3.55-3.76(\mathrm{~m}, 4 \mathrm{H}), 3.8-4.0(\mathrm{~m}, 1 \mathrm{H})$
${ }^{13} \mathbf{C}$ NMR ( $50 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 14.03,22.64,26.13,27.05,27.34,29.29,29.66,31.90,34.18$, $63.88,72.74,79.35,81.23,108.72$

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $359\left[\mathrm{M}^{+}+1\right](1.2), 343\left[\mathrm{M}^{+}-15\right]$ (100), 297 (84.6), 269
(21.8), 109 (28), 95 (55.3), 83 (42.2), 59 (17.0)

Analysis: $\mathrm{C}_{21} \mathrm{H}_{42} \mathrm{O}_{4}(358.6)$ requires C, $70.34 ; \mathrm{H}, 11.8$. Found: C, 70.36 ; H, 11.73.

## Synthesis of compound 270

To a mixture of $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}(7.6 \mathrm{~g}, 23.1 \mathrm{mmol}), \mathrm{K}_{2} \mathrm{CO}_{3}(3.2 \mathrm{~g}, 23.1 \mathrm{mmol})$ and pyridine ( 31 $\mu \mathrm{L}, 385 \mu \mathrm{~mol}, 5 \mathrm{~mol} \%)$ in $t-\mathrm{BuOH}-\mathrm{H}_{2} \mathrm{O}(1: 1,90 \mathrm{~mL})$ cooled at $0^{\circ} \mathrm{C}$ was added osmium tetroxide ( $468 \mu \mathrm{~L}, 0.1 \mathrm{M}$ solution in toluene, $0.6 \mathrm{~mol} \%$ ). After stirring for 5 min at $0^{\circ} \mathrm{C}$, the olefin $253(2.5$ $\mathrm{g}, 7.7 \mathrm{mmol}$ ) was added in one portion. The reaction mixture was stirred at $0^{\circ} \mathrm{C}$ for 24 h and then quenched with solid sodium sulfite ( 3 g ). The stirring was continued for an additional 45 min and then the solution was extracted with EtOAc $(4 \times 30 \mathrm{~mL})$. The combined organic phases were washed (brine), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. Silica gel column chromatography of the crude product using petroleum ether:acetone (7:3) as eluent gave $270(2.3 \mathrm{~g})$ as a white solid.

Yield: $2.3 \mathrm{~g}, 83 \%$

## Synthesis of (2S,3R,4S)-1-O-pivaloyl-3,4-O-isopropylideneoctadecane-1,2,3,4-tetrol, 271

To a solution of $262(1.25 \mathrm{~g}, 3.48 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ and pyridine $(3 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added pivaloyl chloride ( $0.45 \mathrm{~mL}, 3.65 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{~mL})$ dropwise over 30 min . The reaction mixture was allowed to warm to room temperature and stirred overnight. Water ( 15 mL ) was added and the aqueous layer extracted with EtOAc $(3 \times 20 \mathrm{~mL})$. The combined organic extracts were washed (water and then brine), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. The residue was purified by silica gel column chromatography using petroleum ether:acetone (9:1) to give 271 $(1.43 \mathrm{~g})$ as a colorless oil.

Yield: $1.43 \mathrm{~g}, 93 \%$
$[\alpha]_{\underline{D}}^{\mathbf{2 0}}:-17.2\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$
IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max } 3484,2925,1725,1480,1371,1164,1064,458$

Analysis: $\mathrm{C}_{26} \mathrm{H}_{50} \mathrm{O}_{5}$ (442.7) requires $\mathrm{C}, 70.54 ; \mathrm{H}, 11.38$. Found: C, $70.42 ; \mathrm{H}, 11.25$.

## Synthesis of (2R,3S,4S)-1-O-pivaloyl-2-azido-3,4-O-isopropylideneoctadecane-1,3,4-triol,

 272

To a solution of $271(1.2 \mathrm{~g}, 2.7 \mathrm{mmol})$ in dry pyridine ( 3 mL ) and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \mathrm{~mL})$ was added DMAP (cat), followed by $\mathrm{MeSO}_{2} \mathrm{Cl}(0.42 \mathrm{~mL}, 5.4 \mathrm{mmol})$ and the reaction mixture was heated to $60^{\circ} \mathrm{C}$ for 5 h . It was then cooled and quenched with water ( 10 mL ). The aqueous phase was extracted with EtOAc ( $3 \times 20 \mathrm{~mL}$ ). The combined organic extracts were washed (water and then brine), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated to give the crude mesylate, which was used for the next step without further purification.

To the solution of mesylate in dry DMF ( 15 mL ) was added $\operatorname{LiN}_{3}(0.53 \mathrm{~g}, 10.8 \mathrm{mmol})$ and stirred at $80^{\circ} \mathrm{C}$ for 12 h . The reaction mixture was cooled and treated with acetone. The solid material was filtered and washed with acetone. The filtrate was concentrated and the residue was purified by silica gel column chromatography using petrol ether:EtOAc (24:1) to give 272 (1.11 g) as a colorless oil.

Yield: $1.11 \mathrm{~g}, 88 \%$

## Synthesis of (2R,3S,4S)-2-acetamido-1,3,4-triacetoxyoctadecane, 274

To the solution of $273(0.78 \mathrm{~g}, 2.18 \mathrm{mmol})$ in $\mathrm{MeOH}(15 \mathrm{~mL})$ was added $6 \mathrm{~N} \mathrm{HCl}(3 \mathrm{~mL})$ at room temperature and stirred overnight. Solid $\mathrm{NaHCO}_{3}(1 \mathrm{~g})$ was added and the reaction mixture was filtered through a pad of neutral alumina and further eluted with $\mathrm{MeOH}(3 \times 20 \mathrm{~mL})$. The
combined filtrate was concentrated to a white powder of hydrochloride salt, which was subsequently acetylated with pyridine ( 5 mL ), DMAP (cat) and $\mathrm{Ac}_{2} \mathrm{O}(3 \mathrm{~mL})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$. After stirring for 12 h at room temperature the reaction mixture was quenched with water (10 $\mathrm{mL})$. The aqueous layer was extracted with EtOAc $(4 \times 20 \mathrm{~mL})$. The combined organic extracts were washed (water and then brine), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. Silica gel column chromatography of the crude product using petrol ether:EtOAc (3:2) as eluent gave 274 ( 0.69 g ) as a waxy white solid.

Yield: $0.69 \mathrm{~g}, 67 \%$

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$, relative intensity, \%): $427\left[\mathrm{M}^{+}-15\right]$ (100), 383 (1.2), 340 (1.0), 297 (39.7), 158 (10.3), 110 (4.5), 85 (4.5), 57 (5.13)

Analysis: $\mathrm{C}_{26} \mathrm{H}_{50} \mathrm{O}_{5}$ (442.7) requires C, $70.54 ; \mathrm{H}, 11.38$. Found: C, 70.63 ; H, 11.31.

## Compound 280

Colorless oil.

$[\alpha]_{\mathbf{D}}{ }^{\mathbf{2 0}} \boldsymbol{:}-19.12\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$
IR (neat, $\mathbf{c m}^{\mathbf{- 1}}$ ): $\boldsymbol{v}_{\max }$ 2955, 2855, 2102, 1738, 1463, 1371, 1280, 1149, 1099, 477
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 0.88(\mathrm{t}, J=6 \mathrm{~Hz}, 3 \mathrm{H}), 1.24(\mathrm{~s}, 9 \mathrm{H}), 1.25-1.3(\mathrm{~m}, 24 \mathrm{H}), 1.4(\mathrm{~s}$, $3 \mathrm{H}), 1.44(\mathrm{~s}, 3 \mathrm{H}), 1.53(\mathrm{~m}, 2 \mathrm{H}), 3.44-3.7(\mathrm{~m}, 2 \mathrm{H}), 4.01-4.46(\mathrm{~m}, 3 \mathrm{H})$
${ }^{13} \mathbf{C}$ NMR ( $\mathbf{5 0} \mathbf{~ M H z}, \mathbf{C D C l}_{3}$ ): $\delta 13.89,22.52,25.83,26.35,26.9,27.19,29.21,29.51,31.79$, $32.78,33.85,38.62,59.32,64.13,77.26,80.16,109.16,177.61$

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $469\left[\mathrm{M}^{+}+2\right]$ (2.56), $452\left[\mathrm{M}^{+}-15\right]$ (46.15), 297 (100), 280 (19.23), 214 (12), 109 (18), 85 (9), 57 (6.4)

Analysis: $\mathrm{C}_{26} \mathrm{H}_{49} \mathrm{~N}_{3} \mathrm{O}_{4}$ (467.7) requires C, 66.77 ; H, 10.56; N 8.98. Found: C, 66.61 ; H, 10.62; N, 8.84.

## Compound 281

White solid.

M.p.: $61-63^{\circ} \mathrm{C}$
$[\alpha]_{\underline{D}}{ }^{\mathbf{2 0}}:-23.16(\mathrm{c}=1, \mathrm{MeOH})$
IR ( $\left.\mathbf{C H C l}_{\mathbf{3}}, \mathbf{c m}^{\mathbf{- 1}}\right): v_{\max } 3362,3330,2926,1370,768,442$
${ }^{\mathbf{1}} \mathbf{H}$ NMR ( $200 \mathbf{~ M H z}, \mathbf{C D C l}_{3}$ ): $\delta 0.88(\mathrm{t}, J=7 \mathrm{~Hz}, 3 \mathrm{H}), 1.2-1.3(\mathrm{~m}, 24 \mathrm{H}), 1.39(\mathrm{~s}, 6 \mathrm{H}), 1.54(\mathrm{~m}$, $2 \mathrm{H}), 3.0-3.15(\mathrm{~m}, 4 \mathrm{H}), 3.5-3.56(\mathrm{~m}, 3 \mathrm{H}), 3.93(\mathrm{~m}, 1 \mathrm{H})$
${ }^{13} \mathbf{C}$ NMR ( $50 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 13.79,22.35,25.81,26.62,26.95,27.02,29.04,29.37,31.61$, $33.27,33.45,54.63,60.47,78.15,78.66,109.03$

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $359\left[\mathrm{M}^{+}+2\right]$ (1.3), $357\left[\mathrm{M}^{+}\right]$(1.2), 343 (15.4), 327 (18), 298 (15.4), 283 (12.8), 269 (20.5), 167 (30.8), 149 (79.5), 100 (100), 60 (21.8)

Analysis: $\mathrm{C}_{21} \mathrm{H}_{43} \mathrm{NO}_{3}$ (357.6) requires C, 70.53 ; H, 12.12; N, 3.91. Found: C, 70.69; H, 11.96; N, 3.94.

## Compound 282

282
White solid.
M.p.: $53-54^{\circ} \mathrm{C}$
$[\alpha]_{\mathbf{D}}{ }^{\mathbf{2 0}} \boldsymbol{i}-6.62\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)\left[\text { lit }[\alpha]_{\mathrm{D}}{ }^{20}+4.3\left(\mathrm{c}=0.5, \mathrm{CHCl}_{3}\right) \text { for the enantiomer of 282 }\right]^{100}$
IR ( $\left.\mathbf{C H C l}_{3}, \mathbf{c m}^{\mathbf{- 1}}\right): v_{\max } 3430,3020,2927,1740,1681,1218,429$
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ) $\delta 0.85(\mathrm{t}, J=7 \mathrm{~Hz}, 3 \mathrm{H}), 1.2-1.3(24 \mathrm{H}), 1.54(\mathrm{~m}, 2 \mathrm{H}), 1.99(\mathrm{~s}, 3 \mathrm{H})$, $2.03(\mathrm{~s}, 3 \mathrm{H}), 2.06(\mathrm{~s}, 3 \mathrm{H}), 2.1(\mathrm{~s}, 3 \mathrm{H}), 3.92-4.17(\mathrm{~m}, 2 \mathrm{H}), 4.4-4.56(\mathrm{~m}, 1 \mathrm{H}), 4.9-5.17(\mathrm{~m}, 2 \mathrm{H})$, $5.96(\mathrm{~d}, J=10 \mathrm{~Hz}, 1 \mathrm{H})$
${ }^{13} \mathbf{C}$ NMR ( $50 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 13.25,19.7,19.92,20.03,21.9,24.11,24.44,28.59,28.92$, $29.80,30.21,31.16,47.41,62.26,71.49,71.63,169.12,169.52,169.6,169.7$
EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $485\left[\mathrm{M}^{+}\right]$(1.3), 426 (1.2), 292 (12.82), 144 (100), 102 (27), 84 (11.53)

Analysis: $\mathrm{C}_{26} \mathrm{H}_{47} \mathrm{NO}_{7}(485.67) \mathrm{C}, 64.3 ; \mathrm{H}, 9.8 ; \mathrm{N}, 2.88$. Found: C, 64.19; H, 9.71; N, 2.78.

Compounds 283-286 were prepared by the same procedures as described for compounds 271-274 respectively.

## Compound 283

Colorless oil.

$[\alpha]_{\mathrm{D}}{ }^{\mathbf{2 0}}:+15.8\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$
IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max } 3486,2924,1735,1460,1360,1161,1065,490$
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 0.87(\mathrm{t}, J=6 \mathrm{~Hz}, 3 \mathrm{H}), 1.21(\mathrm{~s}, 9 \mathrm{H}), 1.24-1.32(\mathrm{~m}, 24 \mathrm{H}), 1.37(\mathrm{~s}$, $3 \mathrm{H}), 1.4(\mathrm{~s}, 3 \mathrm{H}), 1.53(\mathrm{~m}, 2 \mathrm{H}), 2.32(\mathrm{brs}, 1 \mathrm{H}), 3.61(\mathrm{t}, J=6.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.85-4.0(\mathrm{~m}, 2 \mathrm{H}), 4.05-$ 4.29 (m, 2H)
${ }^{13} \mathbf{C}$ NMR ( $50 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 13.76,22.38,25.71,25.82,27.10,29.05,29.38,31.8,32.69$, $33.98,38.46,65.96,71.14,79.26,80.14,108.30,178.36$

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $427\left[\mathrm{M}^{+}-15\right]$ (100), 383 (1.5), 340 (1.7), 297 (32.6), 158 (10.8), 110 (4.9), 85 (4.8), 57 (7.43)

Analysis: $\mathrm{C}_{26} \mathrm{H}_{50} \mathrm{O}_{5}$ (442.7) requires $\mathrm{C}, 70.54 ; \mathrm{H}, 11.38$. Found: $\mathrm{C}, 70.58 ; \mathrm{H}, 11.41$

## Compound 284

Colorless oil.

$[\alpha]]_{\text {Den }}^{\mathbf{2 0}} \boldsymbol{i}+19.32\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$
IR (neat, $\mathbf{c m}^{\mathbf{- 1}}$ ): $v_{\max }$ 2960, 2855, 2108, 1740, 1471, 1375, 1280, 1155, 1095, 868, 477
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 0.89(\mathrm{t}, J=6 \mathrm{~Hz}, 3 \mathrm{H}), 1.25(\mathrm{~s}, 9 \mathrm{H}), 1.25-1.32(\mathrm{~m}, 24 \mathrm{H}), 1.42(\mathrm{~s}$, $3 \mathrm{H}), 1.44(\mathrm{~s}, 3 \mathrm{H}), 1.55(\mathrm{~m}, 2 \mathrm{H}), 3.44-3.7(\mathrm{~m}, 2 \mathrm{H}), 4.01-4.48(\mathrm{~m}, 3 \mathrm{H})$
${ }^{13} \mathbf{C}$ NMR ( $50 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 13.90,22.54,25.88,26.39,26.96,27.22,29.21,29.51,31.82$, $32.82,33.87,38.64,59.36,64.17,77.27,80.17,109.18,177.62$
EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $469\left[\mathrm{M}^{+}+2\right](3.56), 452\left[\mathrm{M}^{+}-15\right]$ (48.18), 297 (100), 280 (29.23), 214 (12.4), 109 (18.8), 85 (9.6), 57 (8.4)

Analysis: $\mathrm{C}_{26} \mathrm{H}_{49} \mathrm{~N}_{3} \mathrm{O}_{4}$ (467.7) requires C, 66.77 ; H, 10.56; N 8.98. Found: C, 66.71; H, 10.42; N, 8.94.

## Compound 285

White solid.

M.p.: $62-64^{\circ} \mathrm{C}$
$[\alpha]_{\mathrm{D}}{ }^{\mathbf{2 0}} \boldsymbol{i}+23.56(\mathrm{c}=1, \mathrm{MeOH})$
IR ( $\left.\mathbf{C H C l}_{3}, \mathbf{c m}^{\mathbf{- 1}}\right): v_{\max } 3366,3340,2928,1376,775,439$
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 0.88(\mathrm{t}, J=7 \mathrm{~Hz}, 3 \mathrm{H}), 1.2-1.3(\mathrm{~m}, 24 \mathrm{H}), 1.41(\mathrm{~s}, 6 \mathrm{H}), 1.56(\mathrm{~m}$, 2 H ), 3.0-3.15 (m, 4H), 3.5-3.58 (m, 3H), 3.96 (m, 1H)
${ }^{13} \mathbf{C}$ NMR ( $50 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 13.82,22.36,25.81,26.65,26.96,27.04,29.06,29.38,31.66$, $33.29,33.44,54.66,60.49,78.21,78.69,109.06$

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $359\left[\mathrm{M}^{+}+2\right](2.3), 357\left[\mathrm{M}^{+}\right]$(1.8), 343 (15.8), 327 (19.4), 298 (16.4), 283 (10.8), 269 (20.4), 167 (33.8), 149 (79.8), 100 (100), 60 (11.8)

Analysis: $\mathrm{C}_{21} \mathrm{H}_{43} \mathrm{NO}_{3}$ (357.6) requires C, $70.53 ; \mathrm{H}, 12.12$; N, 3.91. Found: C, 70.59; H, 12.06; N, 3.84.

## Compound 286

White solid.
M.p.: $51-52^{\circ} \mathrm{C}$
$[\alpha]_{\underline{D}}{ }^{20}:+6.68\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)\left[\operatorname{lit}[\alpha]_{\mathrm{D}}{ }^{20}+4.3\left(\mathrm{c}=0.5, \mathrm{CHCl}_{3}\right)\right]^{100}$
IR ( $\left.\mathbf{C H C l}_{3}, \mathbf{c m}^{\mathbf{- 1}}\right): v_{\max } 3432,3028,2928,1735,1680,1220,432$
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $0.86(\mathrm{t}, J=7 \mathrm{~Hz}, 3 \mathrm{H}), 1.2-1.32(\mathrm{~m}, 24 \mathrm{H}), 1.56(\mathrm{~m}, 2 \mathrm{H}), 2.02(\mathrm{~s}$, $3 \mathrm{H}), 2.04(\mathrm{~s}, 3 \mathrm{H}), 2.08(\mathrm{~s}, 3 \mathrm{H}), 2.15(\mathrm{~s}, 3 \mathrm{H}), 3.92-4.22(\mathrm{~m}, 2 \mathrm{H}), 4.4-4.58(\mathrm{~m}, 1 \mathrm{H}), 4.9-5.19(\mathrm{~m}$, 2H), 5.98 (d, $J=10 \mathrm{~Hz}, 1 \mathrm{H}$ )
${ }^{13} \mathbf{C}$ NMR ( $50 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 13.28,19.74,19.98,20.05,21.93,24.16,24.46,28.62,28.94$, $29.85,30.23,31.176,47.43,62.27,70.52,71.48,169.15,169.53,169.7,169.9$

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $485\left[\mathrm{M}^{+}\right]$(1.8), 426 (1.5), 292 (18.85), 144 (100), 102 (29), 84 (11.67)

Analysis: $\mathrm{C}_{26} \mathrm{H}_{47} \mathrm{NO}_{7}$ (485.67) requires C, 64.3; H, 9.8; N, 2.88. Found: C, 64.24; H, 9.66; N, 2.82 .

## CHAPTER 4

ENANTIOSELECTIVE SYNTHESIS OF CHIRAL
EPOXIDES via ASYMMETRIC DIHYDROXYLATION: SYNTHESIS OF
(+)-DIOLMYCIN A2 AND
(+)- AND (-)-POSTICLURE

### 4.1. Introduction

Enantiomerically pure epoxides have found widespread applications as chiral building blocks in organic synthesis, ${ }^{1}$ while many bioactive molecules contain the epoxide function as well. The advent of Sharpless asymmetric epoxidation in $1980^{2}$ dramatically facilitated the synthesis of optically active epoxides. ${ }^{3}$ Despite its venerability, an astonishing number of total syntheses of complex natural products rely on this transformation in a pivotal step. While the need of an allylic alcohol system limits the generality of this method, it can be a beneficial feature, since selective and directed epoxidation of only one double bond within a polyene can be achieved.

There are currently only few methods for the direct enantioselective epoxidation of olefins bearing no directing functional groups in close proximity to the double bond. ${ }^{4}$ In contrast, the Sharpless asymmetric dihydroxylation (SAD) of olefins, needless of directing groups has reached a high level of efficiency due to recent advances in reaction conditions and ligands ${ }^{5}$ employed. Thus, enantiomeric excess of greater than $90 \%$ can now be achieved with a number of olefins representing four of the six olefin substitution classes. The chiral 1,2-diol provides varied opportunities to achieve different functionality in asymmetric synthesis. One among them is stereospecific conversion of diol into epoxide. One way of achieving this conversion is by carrying out SAD of allylic halides. For example, the SAD of olefin 1 gives diol 2, which is then converted into the terminal epoxide 3. To get an internal epoxide, the free hydroxyl is converted into a leaving group and the terminal epoxide opened regioselectively to give 5. Second epoxidation gave internal epoxide 6. This strategy has been employed in the synthesis of the insect pheromone ( $6 Z, 9 S, 10 R$ )-9,10-epoxyhenicos-6-ene $7^{6}$ (Scheme 1).

Another method employed to make an epoxide via dihydroxylation, is to involve one hydroxyl in an intramolecular reaction (compound 9) and convert the other hydroxyl into a leaving group (compound 10), followed by releasing the first hydroxyl and epoxidation. This
strategy has been employed in the synthesis of vascular anti-inflammatory eicosanoid $(11 R, 12 S)$ oxidoarachidonic acid $\mathbf{1 3}^{7}$ (Scheme 2).

Scheme 2
When two hydroxyl groups differ in reactivity, one hydroxyl can be converted into a leaving group (compound 17) and displaced by the second hydroxyl to give the epoxide. For example, Mori et al. ${ }^{8}$ synthesized the $(10 R, 11 S)-(+)$-Juvenile Hormone I and II by employing the above strategy (Scheme 3).

Scheme 3
$\alpha, \beta$-Epoxy esters have been conveniently synthesized from corresponding $\alpha, \beta$-dihydroxy esters (19) via conversion of $\alpha$-hydroxyl into a leaving group, either tosylate or nosylate (20). This gives the cis-epoxide (21) (Scheme 4). ${ }^{9}$

Scheme 4

However, treatment of $\alpha, \beta$-dihydroxy ester with HBr in acetic acid gave acetoxy bromide ester (23) or (25), which on basic methanolysis afforded trans-epoxide (24) or (26) respectively (Scheme 5). ${ }^{9}$

Scheme 5
Sharpless et al. ${ }^{10}$ have developed a one-pot conversion of diol into epoxide via a halohydrin ester intermediate. This involves conversion of diol (27) into cyclic orthoacetate (28) followed by opening of a cyclic acetoxonium intermediate (29), generated from the orthoacetate (28) and $\mathrm{Me}_{3} \mathrm{SiCl}, \mathrm{AcBr}$ or $\mathrm{AcCl} / \mathrm{NaI}$ giving 1-acetoxy-2-halide intermediate (30). Subsequent base mediated methanolysis gives epoxide (31) (Scheme 6).

Scheme 6
$\alpha, \beta$-Epoxyesters (24) have also been synthesized from cyclic sulfates (32) obtained from chiral diol with the intermediate formation of 2-bromo-3-hydroxyesters (33) (Scheme 7). ${ }^{11}$

Scheme 7
On the other hand cyclic sulfates obtained from chiral diol on treatment with NaOH in THFMeOH give epoxides directly (Scheme 8). ${ }^{12}$

Scheme 8

Thus, varied approaches from a chiral diol compound to chiral epoxide are available. Although this involves one-pot or more than one-step conversions, many a time it is much more compatible in terms of both, yields and enantioselectivities, to that of direct epoxidation. In our work on the synthesis of bioactive molecules like (+)-diolmycin A2 and (+)- and (-)-posticlure, we have converted the chiral diols obtained via asymmetric dihydroxylation into chiral epoxides and extrapolated them to achieve the synthesis of target molecules.

## ENANTIOSELECTIVE SYNTHESIS OF (+)-DIOLMYCIN A2

### 4.2.1. Introduction

Omura and coworkers, in a search for new anticoccidial agents, recently isolated four active compounds designated diolmycins A1, A2, B1 and B2 (40-43, Figure 1) from the fermentation broth of Streptomyces sp. WK-2955. ${ }^{13}$ Diolmycin A1 showed anticoccidial activity at concentrations ranging above $0.02 \mu \mathrm{~g} / \mathrm{mL}$ and diolmycin A2 at $0.2 \mu \mathrm{~g} / \mathrm{mL}$. Diolmycins B1 and B2 showed poor anticoccidial activity at concentrations above $20 \mu \mathrm{~g} / \mathrm{mL}$. ${ }^{14}$ The structures of diolmycins were determined by spectroscopic analysis. ${ }^{14}$ The coupling constants between the vicinal protons of the two chiral carbons of 40 and 41 were 5.4 and 2.2 Hz respectively, suggesting an erythro-configuration for 40 and a threo-configuration for 41. Diolmycins A1 and A2 are stereoisomers with the structure of 1-(3-indoyl)-4-(p-hydroxyphenyl)-2,3-butanediol. From the chemical synthesis, the relative configurations of diolmycins A1 and A2 were confirmed to be erythro- and threo-isomers, respectively. The structures of diolmycins B1 and B2 were also deduced to be erythro- and threo-1,4-di(p-hydroxyphenyl)-2,3-butanediol respectively.

### 4.2.2. Review of Literature

With the structure elucidation of all diolmycins, the first total synthesis of ( $\pm$ )-diolmycin A1 was reported by Omura and coworkers, ${ }^{14}$ which confirmed the deduced structure and the relative stereochemistry. Subsequently an asymmetric synthesis of diolmycin A1 40, was also reported by Omura and coworkers ${ }^{15}$ by exploiting the principle of kinetic resolution of an allylic alcohol via the Sharpless asymmetric epoxidation. The first asymmetric synthesis of diolmycin A2 41 from L-tartaric acid is recently reported by Kotsuki and coworkers ${ }^{16}$ through the ytterbium(III) trifluoromethanesulfonate catalyzed high-pressure ring opening of an intermediate epoxide with indole as the key step. All these syntheses are described below in fair details.

## Omura et al. ${ }^{14}$ (1993) Scheme 9

In this report the synthesis of ( $\pm$ )-diolmycin A1 40 is described via stereoselective Wittig reaction of 3-(1-tert-butoxycarbonyl)indoleethyltriphenylphosphoniumbromide 47 and 4hydroxyphenylacetaldehyde 49. The resulting cis-olefin 50 is oxidized by osmium tetroxide (cat) and NMO to yield erythro-diol 51. Removal of BOC-protection gave ( $\pm$ )-diolmycin A1 40.

Scheme 9. Reaction conditions: (i) $\mathrm{CBr}_{4}, \mathrm{Ph}_{3} \mathrm{P}$, THF, rt, $15 \mathrm{~min}, 100 \%$. (ii) $\mathrm{Ph}_{3} \mathrm{P}, \mathrm{PhCH}_{3}$, reflux, $18 \mathrm{~h}, 99 \%$. (iii) ( BOC$)_{2} \mathrm{O}, \mathrm{DMAP}, \mathrm{CH}_{3} \mathrm{CN}, \mathrm{rt}, 5 \mathrm{~h}, 72 \%$. (vii) $\mathrm{CF}_{3} \mathrm{CO}_{2} \mathrm{H}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 0^{\circ} \mathrm{C}, 1.3 \mathrm{~h}, 91 \%$.

## Omura et al. ${ }^{15}$ (1993) Scheme 10

Omura and coworkers reported the asymmetric synthesis of (+)-diolmycin A1 40 from commercially available 2 -(p-hydroxyphenyl)ethanol 48. Alcohol 48 was oxidized to aldehyde 49 followed by phenolic hydroxyl protection as TBDPS ether to give 52. Grignard reaction of vinyl magnesium bromide on 52 gave the allylic acohol 53. Kinetic resolution of $( \pm)$ - $\mathbf{5 3}$ via Sharpless asymmetric epoxidation furnished the desired epoxy alcohol (-)-54 in $90 \%$ ee. Stereospecific alkylation of indole with epoxide $\mathbf{5 4}$ in the presence of Lewis acid $\mathrm{SnCl}_{4}$ afforded the diol 55, which on subsequent deprotection of TBDPS group gave (+)-diolmycin A1 40.

Scheme 10. Reaction conditions: (i) $\mathrm{SO}_{3}$-pyridine, $\mathrm{DMSO}^{2} \mathrm{Et}_{3} \mathrm{~N}, 71 \%$. (ii) $t$ - $\mathrm{BuPh}_{2} \mathrm{Si}-\mathrm{Cl}$, imidazole, $95 \%$. ## Kotsuki et al. ${ }^{16}$ (1996) Scheme 11

Kotsuki and coworkers have employed the ytterbium(III) trifluoromethanesulfonate catalyzed high-pressure ring opening of epoxide 62 with indole as the key step in the synthesis of (+)diolmycin A2 41. The required epoxy alcohol 62 is successfully assembled from monotosylate 56 readily available from L-tartaric acid. ${ }^{17}$ Triflation of 56 to 57 , followed by Grignard reaction with $\mathbf{5 8}$ gave the tosylate $\mathbf{6 0}$. Alternatively, $\mathbf{6 0}$ is prepared by adding excess Grignard reagent to 56 to give 59, followed by tosylation. Deprotection of acetonide group in $\mathbf{6 0}$ followed by base treatment afforded the epoxy alcohol 62. The epoxide 62 is opened with indole in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ containing $5 \mathrm{~mol} \% \mathrm{Yb}(\mathrm{OTf})_{3}$ and $5 \mathrm{~mol} \% \mathrm{O}$, by subjecting to a high pressure of 10 kbar and $60^{\circ} \mathrm{C}$ for 42 h to give the adduct 63. Catalytic debenzylation of $\mathbf{6 3}$ provided (+)-diolmycin A2 41.

Scheme 11. Reaction conditions: (i) $\mathrm{Tf}_{2} \mathrm{O}, \mathrm{Et}_{3} \mathrm{~N}$. (ii) p-benzyloxy phenyl magnesium bromide 58, $\mathrm{CuBr}, \mathrm{Et}_{2} \mathrm{O}, 0^{\circ} \mathrm{C}, 75 \%$ from 56. (viii) $\mathrm{H}_{2}, \mathrm{Pd}(\mathrm{OH})_{2} / \mathrm{C}, 100 \%$.

### 4.2.3. Present Work

## Objective

A very few syntheses of diolmycins are documented in the literature either by kinetic resolution or from chiral material like L-tartaric acid. Hence, a general strategy with fewer steps and higher optical purity to achieve the synthesis of all diolmycins is still desirable. The SAD of $\alpha, \beta$-unsaturated esters with trans-olefinic bond provides an excellent approach to threo-diol in high enantiomeric purity. Since (+)-diolmycin A2 41 has a threo-diol configuration, it can easily be derived through the asymmetric dihydroxylation method.

In a recent report, it has been shown that acylation of indole in the presence of Lewis acid is greatly enhanced if $\mathrm{CH}_{3} \mathrm{NO}_{2}$ is employed as cosolvent, ${ }^{18}$ since it greatly increases the solubility of solid indole-Lewis acid complex. This prompted us to explore the possibility of regioselective C-3 alkylation of indole with epoxide in the presence of Lewis acid and the reaction being assisted by $\mathrm{CH}_{3} \mathrm{NO}_{2}$ cosolvent. The SAD reaction of allylic halides ${ }^{6}$ or $\alpha, \beta$-unsaturated esters ${ }^{10}$ can be extended to make terminal or internal epoxides. ${ }^{6,10}$ Thus, the objective of present work is,
(i) to employ SAD reaction in the synthesis of an intermediate epoxide for alkylation of indole and
(ii) to explore the possibility of regioselective C-3 coupling of indole with the intermediate epoxide in the presence of a Lewis acid and employing $\mathrm{CH}_{3} \mathrm{NO}_{2}$ as cosolvent to assist the alkylation reaction towards the synthesis of (+)-diolmycin A2 41 (Figure 2).

Figure 2. Synthetic Strategy

### 4.2.4. Results and Discussion

Schemes 12 and 13 depict the synthetic route to (+)-diolmycin A2 41 by employing the Sharpless asymmetric dihydroxylation to get the threo-diol functionality and its elongation to chiral epoxy alcohol intermediate 62, which is then used for regioselective C-3 coupling of indole. The synthesis of intermediate epoxy alcohol 62 commences from commercially available 4-hydroxy benzaldehyde 64 as shown in Scheme 12. The protection of hydroxyl group of 64 with benzyl bromide in DMF gave 4-benzyloxybenzaldehyde 65 in $99 \%$ yield. The benzylic methylene of $\mathbf{6 5}$ appeared as singlet at $\delta 5.16$ in the ${ }^{1} \mathrm{H}$ NMR spectrum. The subsequent Wittig olefination of 65 with the one carbon ylide generated from methyltriphenylphosphoniumiodide and sodium amide gave the styrene compound $\mathbf{6 6}$ in $78 \%$ yield. The ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{6 6}$ showed olefinic signals of styrene at $\delta 5.59$ (singlet), 5.68 (singlet) and 6.7 (multiplet). 4Benzyloxy styrene 66 was subjected to hydroboration oxidation using $\mathrm{BH}_{3} \cdot \mathrm{Me}_{2} \mathrm{~S}$ complex in THF and alkaline $30 \% \mathrm{H}_{2} \mathrm{O}_{2}$ oxidation to afford the primary alcohol 67 in $88 \%$ yield. The IR spectrum of 67 showed hydroxyl absorption at $3402 \mathrm{~cm}^{-1}$ and the ${ }^{1} \mathrm{H}$ NMR spectrum gave two triplets at $\delta 2.82$ for benzylic methylene and $\delta 3.83$ for hydroxyl methylene. This indicates as expected, the formation of only the primary alcohol in the hydroboration oxidation and not the regioisomeric secondary alcohol. Swern oxidation of alcohol 67 with oxalyl chloride and DMSO at $-78^{\circ} \mathrm{C}$ to $-60^{\circ} \mathrm{C}$ and work-up with $\mathrm{Et}_{3} \mathrm{~N}$ gave the corresponding aldehyde, which was virtually pure by ${ }^{1} \mathrm{H}$ NMR spectrum, showing $\delta 9.8$ singlet for aldehyde proton. The aldehyde was used for subsequent Wittig reaction with (ethoxycarbonylmethylene)triphenylphosphorane in THF at room temperature to give the trans-olefin $\mathbf{6 8}$ in $72 \%$ yield. The IR spectrum of $\mathbf{6 8}$ showed strong absorption at $1713 \mathrm{~cm}^{-1}$ for ester carbonyl and a moderate absorption at $1651 \mathrm{~cm}^{-1}$ for $\mathrm{C}=\mathrm{C}$ stretching of olefin. The olefin proton ( $\alpha$ - to carbonyl) appeared at $\delta 5.85$ (doublet of triplet) and the other, one proton peak merged with aryl protons at $\delta 7.14$ as multiplet. The coupling constant of $J=16 \mathrm{~Hz}$ for olefinic peak indicated trans-olefin. DIBAL-H reduction of the ester group in 68 in $\mathrm{Et}_{2} \mathrm{O}$ at $0^{\circ} \mathrm{C}$ gave the allylic alcohol $\mathbf{6 9}$ in $93 \%$ yield. The IR spectrum of 69 showed hydroxyl absorption at $3339 \mathrm{~cm}^{-1}$ and $\mathrm{C}=\mathrm{C}$ stretching of olefin at $1611 \mathrm{~cm}^{-1}$. The ${ }^{1} \mathrm{H}$ NMR spectrum showed absence of ethyl ester peaks and presence of hydroxyl proton, which appeared as broad singlet at $\delta 2.15$. The hydroxyl methylene protons appeared at $\delta 4.15$ (multiplet) in the ${ }^{1} \mathrm{H}$ NMR spectrum and the corresponding carbon appeared at $\delta 62.96$ in the ${ }^{13} \mathrm{C}$ NMR spectrum. The allylic alcohol 69 was converted into allylic bromide 70 with NBS and
triphenylphosphine in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $-30^{\circ} \mathrm{C}$ in $83 \%$ yield. Both IR and ${ }^{1} \mathrm{H}$ NMR spectra indicated the absence of hydroxyl group. Asymmetric dihydroxylation of allylic bromide 70 in the presence of $\left(\mathrm{DHQ}_{2}-\mathrm{PHAL}\right.$ as chiral ligand gave the diol, which on subsequent treatment with $\mathrm{K}_{2} \mathrm{CO}_{3}$ in dry methanol afforded the epoxide 62 in $73 \%$ yield, having m.p. $67-69^{\circ} \mathrm{C}$ and $[\alpha]_{\mathrm{D}}{ }^{20}+11.07(\mathrm{c}=1$, $\mathrm{CHCl}_{3}$ ) which are in accordance with the literature data, m.p. $68-69^{\circ} \mathrm{C}$ and $[\alpha]_{\mathrm{D}}{ }^{20}+11.2(\mathrm{c}=$ $\left.0.98, \mathrm{CHCl}_{3}\right)^{16}$ respectively. The IR spectrum of $\mathbf{6 2}$ showed strong absorption at $3443 \mathrm{~cm}^{-1}$ for hydroxyl group. The ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{6 2}$ showed epoxide protons appearing upfield at $\delta$ 2.62-2.65 (doublet of doublet, one proton), 2.77 (triplet, one proton) and 3.04 (multiplet, one proton). The ${ }^{13} \mathrm{C}$ NMR spectrum of $\mathbf{6 2}$ showed upfield carbons characteristic of epoxide at $\delta$ 44.87 and 54.61.

Alternatively, the epoxide 62 was prepared from compound 68 following the reaction sequence shown in Scheme 13. The dihydroxylation of olefin 68 using the (DHQ) ${ }_{2}$-PHAL ligand gave the diol 71 in $91 \%$ yield, having $[\alpha]_{\mathrm{D}}{ }^{20}-29.8\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$ and m.p. $104-106^{\circ} \mathrm{C}$. The IR spectrum showed absence of olefin peak, while strong hydroxyl absorption appeared at 3488 $\mathrm{cm}^{-1}$ and ester carbonyl at $1732 \mathrm{~cm}^{-1}$. The ${ }^{1} \mathrm{H}$ NMR spectrum of 71 showed absence of olefin protons. The chiral carbons appeared at $\delta 71.9$ and 73.5 in the ${ }^{13} \mathrm{C}$ NMR spectrum of 71 . The dihydroxyl protection of 71 with 2,2-dimethoxypropane in the presence of catalytic $p$ - TsOH in acetone gave the acetonide $\mathbf{7 2}$ in $99 \%$ yield. The hydroxyl absorption was absent in the $\mathbb{R}$ spectrum of 72. Two singlets at $\delta 1.44$ and 1.48 in the ${ }^{1} \mathrm{H}$ NMR spectrum and a peak at $\delta 110.49$ (acetonide carbon) in the ${ }^{13} \mathrm{C}$ NMR spectrum indicated presence of isopropylidene group in $\mathbf{7 2}$. Reduction of ester group in 72 with $\mathrm{LiAlH}_{4}$ at $0^{\circ} \mathrm{C}$ in $\mathrm{Et}_{2} \mathrm{O}$ gave the alcohol 59 in $97 \%$ yield. The IR spectrum of $\mathbf{5 9}$ showed absence of ester carbonyl, while hydroxyl absorption appeared at $3468 \mathrm{~cm}^{-1}$. In the ${ }^{1} \mathrm{H}$ NMR spectrum of 59 the characteristic triplet and quartet of the ethyl ester disappeared indicating ester group reduction. The free hydroxyl in $\mathbf{5 9}$ was converted into the
tosylate $\mathbf{6 0}$ with $p-\mathrm{TsCl}$ and pyridine in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at room temperature in $90 \%$ yield. The m.p. 83$84^{\circ} \mathrm{C}$ and $[\alpha]_{\mathrm{D}}{ }^{20}-19.62\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$ obtained for $\mathbf{6 0}$ are in accordance with the reported values of m.p. $83.5-84^{\circ} \mathrm{C}$ and $[\alpha]_{\mathrm{D}}{ }^{20}-19.7\left(\mathrm{c}=1.07, \mathrm{CHCl}_{3}\right)^{16}$ respectively. The hydroxyl absorption in the IR spectrum disappeared. The ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{6 0}$ showed aryl methyl at $\delta$ 2.44 (singlet) for tosyl group. The deprotection of acetonide in $\mathbf{6 0}$ was effected with 3 N HCl in MeOH to give the diol which was immediately treated with $\mathrm{K}_{2} \mathrm{CO}_{3}$ in dry MeOH at room temperature to afford the epoxide $\mathbf{6 2}$ in $85 \%$ yield, having $[\alpha]_{\mathrm{D}}{ }^{20}+11.12\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$ and m.p. $67-69^{\circ} \mathrm{C}$. All spectroscopic data matched well with that of $\mathbf{6 2}$ prepared as per Scheme 12.

With the enantiomerically pure epoxide 62 in hand the next step involved an efficient coupling with indole at the C-3 position. Although, the 3 -position is the most reactive site for electrophilic attack, low yields are usually encountered due to the competitive formation of 1-alkylated and/or 1,3-dialkylated products often associated with self polymerization of indole as side product. ${ }^{19}$ However the recent report about an improved synthesis of 3 -acylindoles by Ottoni et al. ${ }^{18}$ prompted us to explore the Lewis acid catalyzed regioselective $\mathrm{C}-3$ coupling of indole with epoxide 62 for diolmycin synthesis. It has been observed that in C-3 acylation of indole using Lewis acid, the addition of $\mathrm{CH}_{3} \mathrm{NO}_{2}$ as co-solvent greatly increases the solubility of the solid indole-Lewis acid complex in the reaction media, shortening the reaction time and raising the yields significantly. ${ }^{18}$ Indeed, following the above procedure, the treatment of epoxide 62 with indole in a mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and $\mathrm{CH}_{3} \mathrm{NO}_{2}$ (4:3) in the presence of $\mathrm{SnCl}_{4}$ as the Lewis acid gave the $\mathrm{C}-3$ coupled product in good yield. A probable mechanism of this reaction is depicted in Scheme 14. Presumably the Lewis acid $\mathrm{SnCl}_{4}$ complexes at 3-position of indole, it being the most reactive site for electrophilic attack. The intermediate thus formed would then collapse in a nucleophilic attack toward the epoxide, eventually leading to the $\mathrm{C}-3$ coupled indole. The subsequent deprotection of benzyl group with $10 \% \mathrm{Pd}-\mathrm{C}$ in EtOH under $\mathrm{H}_{2}$ atmosphere furnished (+)-diolmycin A2 41 in $53 \%$ yield. The $[\alpha]_{D}{ }^{20}+46.32(\mathrm{c}=0.2, \mathrm{MeOH})$ obtained for $(+)-41$ is in accordance with reported value of $[\alpha]_{\mathrm{D}}{ }^{27}+49.2(\mathrm{c}=0.24, \mathrm{MeOH}) .{ }^{16}$ The structure of $(+)-41$ was confirmed by IR, ${ }^{1} \mathrm{H}$ NMR, and EIMS analysis. The IR spectrum of ( + ) $-\mathbf{4 1}$ showed hydroxyl and NH- absorptions at $3417 \mathrm{~cm}^{-1}$. The protons of chiral carbons appeared in the ${ }^{1} \mathrm{H}$ NMR spectrum of (+)-41 at $\delta 3.66$ and 3.9 (doublet of doublet of doublet each) with a coupling constant of $J=2 \mathrm{~Hz}$, indicating the expected threo-configuration. The EIMS showed a molecular ion peak at $m / z 297$ and a peak at $m / z 130$, characteristic of the indole moiety.

Scheme 14. Alkylation of the Complex Indole- $\mathrm{SnCl}_{4}$

To determine the enantiomeric purity, the compounds 62 (Scheme 12) and 59 were converted into their corresponding Mosher esters with (S)-(+)-2-methoxy- $\alpha$-trifluoromethyl-acetylchloride, pyridine and DMAP (cat) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solvent. The diastereomers formed were analyzed by ${ }^{1} \mathrm{H}$ NMR and ${ }^{19}$ F NMR spectra. Analysis indicated an enantiomeric purity of greater than $95 \%$ ee.

Figure 3. ${ }^{19}$ F NMR Spectra of Mosher esters of $\mathbf{5 9}$ and $\mathbf{6 2}$.

### 4.2.5. Conclusion

In summary, a highly enantioselective synthesis of (+)-diolmycin A2 41, a recently discovered anticoccidial antibiotic has been achieved from readily accessible starting material, 4hydroxybenzaldehyde by a simple and operationally feasible synthetic strategy. ${ }^{20}$

There are two noteworthy features in the synthetic strategy employed.
(i) the application of SAD reaction to produce a chiral diol and subsequent conversion of the diol into epoxide intermediate 62 in high enantiomeric purity.
(ii) the intermolecular highly regioselective $\mathrm{C}-3$ coupling of indole, assisted by $\mathrm{CH}_{3} \mathrm{NO}_{2}$ as cosolvent, which greatly assists the reaction by increasing the solubility of the solid indole-lewis acid complex. A probable mechanism for this reaction is also proposed.

The synthetic strategy employed has significant potential for further extension to the asymmetric synthesis of other analogues of diolmycin A2 by either changing the chiral ligand employed in the SAD reaction or using the cis-olefin in place of the trans-olefin to get the erythro-diol functionality (present in diolmycin A1 40 and B1 42). While quite a few synthetic approaches towards diolmycins are known, this new route with high yielding steps and enantiomeric purity will provide an alternative to diolmycin synthesis for biological evaluations.

### 4.2.6. Experimental section

## General Information

Solvents were purified and dried by standard procedures before use. Petroleum ether of boiling range $60-80^{\circ} \mathrm{C}$ was used. Melting points are uncorrected. Optical rotations were measured using sodium D line on a JASCO P-1020 microprocessor based polarimeter. Infrared spectra were recorded on ATI MATTSON RS-1 FT-IR spectrometer. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Bruker AC-200 spectrometer with residual $\mathrm{CHCl}_{3}$ as internal standard ( $\delta 7.27{ }^{1} \mathrm{H}$ NMR and $\delta 77.00{ }^{13} \mathrm{C}$ NMR). Mass spectra were obtained with a TSQ 70, Finningen MAT mass spectrometer. Elemental analyses were carried out on a Carlo Erba CHNS-O analyzer.

## Preparation of 4-benzyloxybenzaldehyde, 65

To a stirred suspension of $\mathrm{K}_{2} \mathrm{CO}_{3}(34 \mathrm{~g}, 246 \mathrm{mmol})$ in dry DMF ( 200 mL ) at room temperature was added 4-hydroxybenzaldehyde $64(20 \mathrm{~g}, 163.93 \mathrm{mmol})$ and TBAI (cat). The mixture was stirred for 30 min and then benzylbromide ( $28.5 \mathrm{~g}, 166.6 \mathrm{mmol}$ ) was added. The reaction mixture was stirred at room temperature for 24 h and then quenched with water and extracted with EtOAc ( $3 \times 100 \mathrm{~mL}$ ). The combined organic extracts were washed with water ( 2 $\times 100 \mathrm{~mL})$, brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. Silica gel column chromatography of the crude product using petroleum ether:EtOAc (85:15) as eluent gave $\mathbf{6 5}(34.41 \mathrm{~g})$ as a white solid.

Yield: 34.41 g , $99 \%$
Мр.: $78-79^{\circ} \mathrm{C}$
IR ( $\left.\mathbf{C H C l}_{\mathbf{3}}, \mathbf{c m}^{\mathbf{- 1}}\right): v_{\max } 2728,1690,1601,1578,832,758$
${ }^{\mathbf{1}} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 5.16(\mathrm{~s}, 2 \mathrm{H}), 7.1(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}), 7.3(\mathrm{~m}, 5 \mathrm{H}), 7.85(\mathrm{~d}, J=8$ $\mathrm{Hz}, 2 \mathrm{H}), 9.9$ ( $\mathrm{s}, 1 \mathrm{H}$ )
EIMS $\boldsymbol{m} / \boldsymbol{z}$ (relative intensity, \%): $212\left[\mathrm{M}^{+}\right]$(4.3), 91 (100), 65 (9.5)
Analysis: $\mathrm{C}_{14} \mathrm{H}_{12} \mathrm{O}_{2}(212.3)$ requires $\mathrm{C}, 79.23 ; \mathrm{H}, 5.69$. Found: $\mathrm{C}, 79.18 ; \mathrm{H}, 5.74$.

## Preparation of 4-benzyloxystyrene, 66

To a mixture of methyltriphenylphosphoniumiodide ( $24 \mathrm{~g}, 59.35 \mathrm{mmol}$ ) and sodium amide ( $3.48 \mathrm{~g}, 89.23 \mathrm{mmol}$ ) was added dry THF ( 150 mL ) and stirred for 12 h at room temperature. The yellow supernatant liquid was added through a syringe to the solution of $\mathbf{6 5}(10 \mathrm{~g}, 47.11$ mmol) in dry THF ( 20 mL ). The reaction mixture was stirred for 24 h at room temperature and then quenched with $2 \%$ aq. HCl and extracted with EtOAc $(3 \times 100 \mathrm{~mL})$. The combined organic extracts were washed with water $(2 \times 100 \mathrm{~mL})$, brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. Silica
gel column chromatography of the crude product using petroleum ether:EtOAc (95:5) as eluent gave $66(7.72 \mathrm{~g})$ as a white solid.
Yield: $7.72 \mathrm{~g}, 78 \%$
Mp.: $71-72^{\circ} \mathrm{C}\left(\text { lit. } 68-69^{\circ} \mathrm{C}\right)^{16}$
IR ( $\left.\mathbf{C H C l}_{3}, \mathbf{c m}^{-1}\right): v_{\max } 1606,1510,836,759$

## Synthesis of ethyl trans-4-(p-benzyloxyphenyl)but-2-enoate, 68

To a solution of oxalyl chloride ( $5.48 \mathrm{~g}, 46 \mathrm{mmol}$ ) in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$ was added dropwise DMSO ( $6.53 \mathrm{~mL}, 91.98 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ over 15 min . The reaction mixture was stirred for 30 min and a solution of $67(7 \mathrm{~g}, 30.66 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$ was added dropwise over 15 min . The reaction mixture was stirred for 30 min at $-78^{\circ} \mathrm{C}$ and 30 min at $-60^{\circ} \mathrm{C}$ and then $\mathrm{Et}_{3} \mathrm{~N}(15 \mathrm{~mL})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ was added dropwise and stirred for 1 h . The reaction mixture was poured into $10 \%$ aq. $\mathrm{HCl}(100 \mathrm{~mL})$ and the organic layer separated. The aqueous layer was extracted with $\mathrm{EtOAc}(3 \times 50 \mathrm{~mL})$ and the combined organic layers were washed (brine), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated to give the crude aldehyde. This was used for the next step without further purification.

To a solution of (ethoxycarbonylmethylene)triphenylphosphorane ( $10.5 \mathrm{~g}, 30.14 \mathrm{mmol}$ ) in dry THF ( 30 mL ) was added a solution of the above aldehyde in dry THF ( 10 mL ). The reaction mixture was stirred at room temperature for 24 h . It was then concentrated and the residue purified by silica gel column chromatography using petroleum ether:EtOAc (9:1) as eluent to give $\mathbf{6 8}(6.54 \mathrm{~g})$ as a pale yellow oil.
Yield: $6.54 \mathrm{~g}, 72 \%$
IR (neat, $\mathbf{c m}^{\mathbf{- 1}}$ ): $\boldsymbol{v}_{\max } 1713,1651,1609,1509,910,733$

EIMS $\boldsymbol{m} / \boldsymbol{z}$ (relative intensity, \%): $296\left[\mathrm{M}^{+}\right]$(13.7), 251 (1.8), 127 (10.7), 91 (100), 65 (2.9)
Analysis: $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{O}_{3}$ (296.35) requires C, 77.00 ; H, 6.80. Found: C, 77.02; H, 6.72.

## Synthesis of trans-4-(p-benzyloxyphenyl)-but-2-ene-1-ol, 69

To a stirred solution of $\mathbf{6 8}(1.5 \mathrm{~g}, 5.06 \mathrm{mmol})$ in dry ether $(75 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added DIBAL$\mathrm{H}(12.7 \mathrm{~mL}, 12.7 \mathrm{mmol}, 1 \mathrm{M}$ solution in toluene) dropwise over 15 min . The reaction mixture was stirred for 1 h at $0^{\circ} \mathrm{C}$ and 30 min at room temperature. It was cooled again to $0^{\circ} \mathrm{C}$ and quenched with 2 N HCl . The resulting gel was dissolved by adding 6 N HCl . The organic layer was separated and aqueous layer extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20 \mathrm{~mL})$. The combined organic layers were washed (brine), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. Silica gel column chromatography of the crude product using petroleum ether:EtOAc (9:1) as eluent gave $69(1.2 \mathrm{~g})$ as a colorless liquid.

Yield: $1.2 \mathrm{~g}, 93 \%$
IR (neat, $\mathbf{c m}^{\mathbf{- 1}}$ ): $\boldsymbol{v}_{\max } 3339,1611,1600,1510,811,755$
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 2.15(\mathrm{brs}, 1 \mathrm{H}), 3.35(\mathrm{~d}, J=6 \mathrm{~Hz}, 2 \mathrm{H}), 4.15(\mathrm{~m}, 2 \mathrm{H}), 5.06(\mathrm{~s}$, $2 \mathrm{H}), 5.62-5.93(\mathrm{~m}, 2 \mathrm{H}), 6.95(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}), 7.31(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}), 7.4-7.48(\mathrm{~m}, 5 \mathrm{H})$

## Synthesis of ethyl-(2R,3S)-4-(p-benzyloxyphenyl)-2,3- $O$-isopropylidenedioxybutanoate, 72

To a solution of $71(2.5 \mathrm{~g}, 7.56 \mathrm{mmol})$ and $p-\mathrm{TsOH}$ (cat) in dry acetone ( 75 mL ) was added 2,2-dimethoxypropane ( $1.2 \mathrm{~g}, 1.4 \mathrm{~mL}, 11.35 \mathrm{mmol}$ ) and stirred overnight. A pinch of $\mathrm{NaHCO}_{3}$ was added and stirred for 10 min . The reaction mixture was filtered through a short pad of neutral alumina and concentrated. Column chromatography of the crude product using petroleum ether:EtOAc as eluent (9:1) gave $72(2.77 \mathrm{~g})$ as a colorless oil.

Yield: $2.77 \mathrm{~g}, 99 \%$

## Synthesis of diolmycin A2, 41

To a stirring solution of indole ( $21 \mathrm{mg}, 179 \mu \mathrm{~mol}$ ) in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \mathrm{~mL})$ under argon atmosphere at $0^{\circ} \mathrm{C}$ was added $\mathrm{SnCl}_{4}(25 \mu \mathrm{~L}, 207 \mu \mathrm{~mol})$. The ice bath was removed and the reaction mixture was stirred for 45 min at room temperature. The epoxide $62(40 \mathrm{mg}, 148 \mu \mathrm{~mol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL})$ was added in small portions to the suspension, followed by $\mathrm{CH}_{3} \mathrm{NO}_{2}(3 \mathrm{~mL})$. The mixture was stirred for 10 h at room temperature and then quenched with cold water (10 mL ) and EtOAc ( 20 mL ). The mixture was filtered and the organic layer was separated. The aqueous layer was extracted with EtOAc $(2 \times 15 \mathrm{~mL})$. The combined organic layers were washed (brine), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated to a syrupy liquid. This was dissolved in dry EtOH (10 mL ) and $10 \% \mathrm{Pd}-\mathrm{C}(25 \mathrm{mg})$ was added carefully. The reaction mixture was stirred under an atmosphere of $\mathrm{H}_{2}$ filled in a balloon fr 18 h at room temperature. The mixture was filtered and concentrated under reduced pressure. The residue was purified by silica gel column chromatography using $\mathrm{CHCl}_{3}: \mathrm{MeOH}(5: 1)$ as eluent to give diolmycin A2 $41(21 \mathrm{mg})$ as a thick syrupy liquid.
Yield: $21 \mathrm{mg}, 53 \%$

### 4.3. SECTION B

## ENANTIOSELECTIVE SYNTHESIS OF (+)- AND (-)-POSTICLURE.

### 4.3.1. Introduction:

The need for pure enantiomers is particularly apparent in the field of insect pheromone chemistry, since insect chemoreception can be highly stereoselective. ${ }^{21-23}$ Optically active epoxides are an important class of natural products commonly encountered as sex attractants of Lepidopteran pests, ${ }^{24}$ and self defensive substances against rice blast disease. ${ }^{25}$ Many monoepoxy compounds with Z-ene, Z,Z-diene and Z,Z,Z-triene and saturated analogues, common being (+)-dispalure 73, identified as attractant pheromones, have a unique and common feature i.e. cis-epoxide functionality. ${ }^{26}$ No trans-epoxide pheromone was known in the literature until Wakamura et al. ${ }^{27}$ (2001) isolated for the first time in the history of epoxide pheromones, a novel trans-oxirane pheromone from the virgin females of the tussock moth, Orgyia postica and identified it as $(6 Z, 9 Z, 11 S, 12 S)$-trans-11,12-epoxyhenicosa- 6,9 -diene 74 . This novel transoxirane pheromone was named 'posticlure' in reference to the species name (Figure 4).

(+)-Dispalure 73

(-)-Posticlure 74

Figure 4.
The larvae of Orgyia postica were collected in mango fields and reared on an artificial diet. A solvent extract of the sex pheromone glands was obtained from ca. 600 virgin females and analyzed with a capillary GC linked directly to electroantennographic (EAG) recording ${ }^{28}$ from the antenna of a male $O$. postica. Single EAG response was observed at Kovat's Index (KI) 2548 on a polar HP-INNOWAX column, and KI 2200 on a non-polar HP-1 column. The EAG active compound was eluted gas chromatographically as an almost pure material with $5 \%$ ether in $n$ hexane from column chromatography using 200 mg of Florisil. The EAG response coincided
well with an FID peak on the GC, which was predominant in the fraction that represented approximately 17 ng per female abdominal tip.

The EAG active compound was fully characterized by GC-MS, ${ }^{1} \mathrm{H}$ NMR, chiral HPLC analysis and chemical derivation and further by chemical synthesis. In the ${ }^{1} \mathrm{H}$ NMR spectrum, the two epoxide protons at $\delta 2.82$ (doublet of triplet) and 3.36 (doublet of doublet) had a coupling constant of $J=2.2 \mathrm{~Hz}$ which confirmed the trans-epoxide structure. The stereoisomerism possible for posticlure was $(11 S, 12 S)$ or $(11 R, 12 R)$. Both isomers were synthesized separately and analyzed by chiral HPLC. The natural pheromone showed only one peak with the same retention time of synthetic $(11 S, 12 S)$-posticlure. Furthermore males were captured by this $(11 S, 12 S)$-isomer but not by the $(11 R, 12 R)$-isomer. Hence, the $(11 S, 12 S)$ configuration was assigned to the natural sex pheromone of Orgyia postica females.

### 4.3.2. Review of Literature

## Wakamura et al. ${ }^{27}$ (2001) Scheme 14

Wakamura et al. ${ }^{27}$, besides isolation and structure elucidation, in the same report have arrived at the synthesis of both enantiomers of posticlure by employing the Sharpless asymmetric epoxidation ${ }^{2}$ as the key step (Scheme 14). Decanal 75 on Wittig reaction with stable phosphorane gave methyl trans-dodec-2-enoate 76. Reduction of ester 76 gave the allylic alcohol 77. The Sharpless asymmetric epoxidation of 77 using (+)-DET gave the epoxide 78. The free hydroxyl in 78 was oxidized with PCC to the corresponding aldehyde 79. Reaction of aldehyde 79 with the Wittig ylide 80 gave the natural posticlure 74. The enantiomeric purity was only $59 \%$ and pure material was obtained by preparative HPLC with a chiral column (Chiral-Pak AD).

Scheme 14. Reaction conditions: (i) $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{CHCO}_{2} \mathrm{Me}$. (ii) $\mathrm{LiAlH}_{2}$ (OEt) $)_{2}$. (iii) (+)- DET , $\mathrm{Ti}(\mathrm{O} i-$ $\operatorname{Pr})_{4}, t-\mathrm{BuOOH}$. (iv) PCC . (v) $(\mathrm{Z})-\mathrm{Ph}_{3} \mathrm{P}=\mathrm{CH}-\mathrm{CH}_{2}-\mathrm{CH}=\mathrm{CH}-\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3} 8 \mathbf{8}$.

## Mori et al. ${ }^{29 \mathrm{a}}$ (2001) Scheme 15

Mori et al. synthesized the intermediate aldehyde 79 (also prepared by Wakamura et al. ${ }^{27}$ ). The SAD of olefin 76 gave diol 82 . The $\alpha$-hydroxyl was converted into $\alpha$-bromide $\mathbf{8 3}$ via the acetoxonium ion chemistry. Base mediated methanolysis of $\mathbf{8 3}$ gave the epoxide $\mathbf{8 4}$, which on DIBAL-H reduction of ester furnished the aldehyde 79. The subsequent Wittig reaction with 80 afforded the natural pheromone epoxide posticlure 74.

### 4.3.3. Present Work ${ }^{29 b}$

## Objective:

With the advent of Sharpless asymmetric epoxidation (SAE) ${ }^{2}$ several synthesis of pheromone epoxides such as (+)-dispalure $\mathbf{7 3},{ }^{30,31}(3 Z, 6 Z)$-cis- 9,10 -epoxy-3,6-henicosadiene $\mathbf{8 5},{ }^{31}(3 Z, 6 Z)$ -cis-9,10-epoxy-1,3,6-henicosatriene $\mathbf{8 6},{ }^{32} \quad(6 Z, 9 Z, 3 S, 4 R)$-cis-3,4-epoxynonadecadiene 87 and $(3 Z, 6 Z)$-cis-9,10-epoxy-1,3,6-icosatriene $\mathbf{8 8}^{33}$ (Figure 5) were reported by employing SAE reaction. Current literature documents a very few methods for preparing chiral epoxides of olefins bearing no directing functional groups in close proximity to the double bond. ${ }^{4}$ The Sharpless asymmetric dihydroxylation has been envisaged as an alternative way for conversion of diol into an epoxide function. ${ }^{6-12}$

Figure 5. Some epoxide pheromones synthesized via SAE reaction.

The Sharpless method ${ }^{10}$ of one-pot conversion of vicinal diols into epoxides via halohydrin ester intermediates seemed to be an easy alternative. This method tolerates a wide range of functionality including acid-sensitive functional groups and the transformation proceeds without epimerisation even with benzylic substrates in high yields and stereospecificity.

Since Wakamura ${ }^{27}$ synthesized both enantiomers of posticlure by SAE reaction with $59 \%$ ee and obtained pure samples by preparative HPLC, an upsurge of interest in the asymmetric synthesis of such a novel first trans-epoxide pheromone in both large scale and high optical purity led us to employ the SAD reaction towards the synthesis of posticlure. Enormous opportunities are available for synthetic manipulation by the SAD of internal activated olefins like $\alpha, \beta$-unsaturated esters, allylic alcohols or allylic halides to produce chiral diols followed by their conversion into epoxide by a one-pot sequence in high yields and stereospecificity.

### 4.3.4. Results and Discussion:

The synthetic strategy for both (+)- and (-)-posticlure is depicted in Schemes 16-19. The key steps involve the Sharpless asymmetric dihydroxylation and one-pot conversion of diol into epoxide. In Scheme 16, the synthesis of intermediate diol 98 is depicted. The commercially available decanal 89 was chosen as starting material, which on Wittig reaction with (ethoxycarbonylmethylene)triphenylphosphorane in THF at room temperature afforded the trans-olefin 90 in $86 \%$ yield. The IR spectrum of 90 showed strong carbonyl absorption at 1724 $\mathrm{cm}^{-1}$ and $\mathrm{C}=\mathrm{C}$ stretching of olefin at $1656 \mathrm{~cm}^{-1}$. In the ${ }^{1} \mathrm{H}$ NMR spectrum, the olefin peaks appeared at $\delta 5.76$ and 6.95 , both as doublet of triplet with the coupling constant of $J=16 \mathrm{~Hz}$, indicating trans-olefin. The SAD reaction of olefin 90 using $(\mathrm{DHQ})_{2}$-PHAL ligand and catalytic $\mathrm{OsO}_{4}$ gave the diol 91 in $94 \%$ yield. The IR spectrum of 91 showed hydroxyl absorption at 3377 $\mathrm{cm}^{-1}$ and ester carbonyl absorption at $1736 \mathrm{~cm}^{-1}$. The protons of the chiral carbons appeared at $\delta$ 3.84 (broad triplet) and 4.05 (multiplet) in the ${ }^{1} \mathrm{H}$ NMR spectrum and the corresponding carbons appeared at $\delta 72.44$ and 73.25 in the ${ }^{13} \mathrm{C}$ NMR spectrum. The hydroxyl group protection of 91 with 2,2-dimethoxypropane in presence of catalytic amount of $p-\mathrm{TsOH}$ at room temperature furnished 92 in almost quantitative yield. The characteristic acetonide group appeared at $\delta 1.41$ (singlet) and 1.43 (singlet) for two methyl protons in the ${ }^{1} \mathrm{H}$ NMR spectrum and the acetonide carbon at $\delta 109.97$ in the ${ }^{13} \mathrm{C}$ NMR spectrum. Reduction of the ester group of 92 with $\mathrm{LiAlH}_{4}$ in $\mathrm{Et}_{2} \mathrm{O}$ at $0^{\circ} \mathrm{C}$ to room temperature gave the alcohol 93 in $97 \%$ yield. Compound 93 showed hydroxyl absorption at $3460 \mathrm{~cm}^{-1}$ and absence of ester carbonyl in the IR spectrum.

The further reaction involved the treatment of aldehyde derived from alcohol 93 with the ylide derived from Wittig salt 96. The Wittig salt 96 was prepared from commercially available cis-3-nonen-1-ol (94) in two steps. The hydroxyl group of 94 was converted into iodide 95 with triphenylphosphine, iodine and imidazole followed by reaction of iodide 95 with triphenylphosphine in benzene under reflux to give 96 as a sticky white solid. This was used immediately after preparation. The alcohol 93 was oxidized under Swern oxidation conditions using DMSO and $(\mathrm{COCl})_{2}$ at $-78^{\circ} \mathrm{C}$ to $-60^{\circ} \mathrm{C}$ and workup with $\mathrm{Et}_{3} \mathrm{~N}$ to give the corresponding aldehyde. The aldehyde prepared from 93 was treated with the ylide generated from 96 and $n$ BuLi at $-80^{\circ} \mathrm{C}$ to give the $Z, Z$-olefin 97 in $76 \%$ yield. The IR spectrum of 97 showed $\mathrm{C}=\mathrm{C}$ stretching at $1723 \mathrm{~cm}^{-1}$. In the ${ }^{1} \mathrm{H}$ NMR spectrum of 97 the olefin protons appeared at $\delta 5.3-5.5$ as multiplet (three protons) and 5.7 as doublet of triplet (one proton) with the coupling constant
of $J=8 \mathrm{~Hz}$ indicating cis-olefin. The ${ }^{13} \mathrm{C}$ NMR showed four olefinic carbons at $\delta$ 126.45, 126.51, 130.63 and 133.57 indicating diene formation. The acetonide deprotection of 97 was effected with aq. 3 N HCl in MeOH at room temperature to give the diol-diene 98 in $90 \%$ yield. The hydroxyl absorption in the IR spectrum appeared at $3384 \mathrm{~cm}^{-1}$. The ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra showed the absence of characteristic acetonide group peaks.

Scheme 16. Reaction conditions: (i) $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{CHCO}_{2} \mathrm{Et}, \mathrm{THF}, \mathrm{rt}, 12 \mathrm{~h}, 86 \%$. The ent-103 (Scheme 17) was synthesized by employing the (DHQD) $)_{2}$-PHAL ligand in the SAD reaction of 90 and following the same reaction sequence as in Scheme 16.

It is known that in the SAD reaction under the heterogeneous ferricyanide conditions, the asymmetric dihydroxylation may be controlled to selectively produce enediols from conjugated polyenes. ${ }^{34}$ The regioselectivity of monodihydroxylation is determined both by electronic and steric effects. It has been shown that the rate constants for dihydroxylation of isolated double

Scheme 17. bonds is much larger with trans-1,2-disubstituted and trisubstituted olefins than with cis-1,2disubstituted and terminal olefins. ${ }^{35}$

Taking advantage of trans-olefin dihydroxylation to be faster than the cis-olefin, we thought of preparing compound $\mathbf{9 8}$ or $\mathbf{1 0 3}$ by selective monodihydroxylation of the trans-olefin of a ( $Z, Z, E$ )-triene system like 105 . To explore the possibility of selective monodihydroxylation, the triene 105 was prepared as shown in Scheme 18. DIBAL-H reduction of 90 in $\mathrm{Et}_{2} \mathrm{O}$ at $0^{\circ} \mathrm{C}$ gave the allylic alcohol $\mathbf{1 0 4}$ in $90 \%$ yield. The IR spectrum of $\mathbf{1 0 4}$ showed hydroxyl absorption at $3393 \mathrm{~cm}^{-1}$ and absence of carbonyl function. The allylic hydroxyl was oxidized with PCC in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at room temperature to give the corresponding aldehyde in virtually pure form. Wittig olefination of the above aldehyde with the ylide generated from 96 and $n$ - BuLi at $-80^{\circ} \mathrm{C}$ gave the $(6 Z, 9 Z, 11 E)$-triene 105 in $74 \%$ yield. The triene $\mathbf{1 0 5}$ showed olefinic $\mathrm{C}=\mathrm{C}$ stretching at 1680 and $1642 \mathrm{~cm}^{-1}$ in the IR spectrum. In the ${ }^{1} \mathrm{H}$ NMR spectrum, the olefinic protons appeared at $\delta 5.38$ 5.63 (multiplet, 4 protons), 5.99 (multiplet, 1 proton), 6.24 (doublet of doublet, 1 proton) with the coupling constant of $J=15 \mathrm{~Hz}$ indicating one trans-olefin bond. In the ${ }^{13} \mathrm{C}$ NMR spectrum, the six olefinic carbons appeared at $\delta$ 125.81, 128.98, 129.49, 130.48, 130.81 and 134.53. Chemoselective dihydroxylation of triene $\mathbf{1 0 5}$ with $(\mathrm{DHQ})_{2}$-PHAL ligand ( $1 \mathrm{~mol} \%$ ) and slightly lower concentration of $\mathrm{OsO}_{4}(0.2 \mathrm{~mol} \%)$ gave the monodihydroxylated product 98 in $78 \%$ yield. Similarly 103 was obtained from triene 105 by SAD reaction using (DHQD) $)_{2}$-PHAL ligand in $79 \%$ yield. The $[\alpha]_{D}{ }^{20}$ values and other spectral characteristics of $\mathbf{9 8}$ and 103 matched well with the same prepared through Schemes 16 and 17 respectively. The enantiomeric excess of $>97 \%$
ee was determined by comparison of optical rotations of $\mathbf{9 8}$ and 103 with that prepared by Schemes 16 and 17 respectively.

Scheme 18. Reaction conditions: (i) DIBAL-H, $\mathrm{Et}_{2} \mathrm{O}, 0^{\circ} \mathrm{C}, 2 \mathrm{~h}, 90 \%$. (ii) (a) $\mathrm{PCC}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rt}, 8$ h, (b) 96, $n$-BuLi, THF, $-80^{\circ} \mathrm{C}, 8 \mathrm{~h}, 74 \%$. (iii) $(\mathrm{DHQ})_{2}$-PHAL, $\mathrm{OsO}_{4}, \mathrm{MeSO}_{2} \mathrm{NH}_{2}, \mathrm{~K} 3 \mathrm{Fe}(\mathrm{CN})_{6}$, $\mathrm{K}_{2} \mathrm{CO}_{3}, t-\mathrm{BuOH}: \mathrm{H}_{2} \mathrm{O}$ (1:1), $12 \mathrm{~h}, 0^{\circ} \mathrm{C}, 78 \%$. (iv) (DHQD) $)_{2}$-PHAL, $\mathrm{OsO}_{4}, \mathrm{MeSO}_{2} \mathrm{NH}_{2}$, $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}, \mathrm{~K}_{2} \mathrm{CO}_{3}, t$ - $\mathrm{BuOH}: \mathrm{H}_{2} \mathrm{O}(1: 1), 12 \mathrm{~h}, 0^{\circ} \mathrm{C}, 79 \%$.

With the enantiomerically pure diols 98 and 103 in hand, the next crucial step was to convert them into the epoxides via a one-pot reaction sequence (Scheme 19). Treatment of diol 98 with trimethylorthoacetate and catalytic $p-\mathrm{TsOH}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at room temperature and subsequent removal of the volatiles gave the cyclic ortho ester 106. Subsequent treatment of 106 in the same reaction flask with 1.3 equivalents of acetyl bromide in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ for 4 h at room temperature gave the mixture of virtually pure acetoxy bromides 107 a and $\mathbf{1 0 7 b}$. The ${ }^{1} \mathrm{H}$ NMR spectrum of a fraction of the reaction mixture after filtration and concentration showed protons of the chiral carbons at $\delta 4.96$ (multiplet) and 5.09 (multiplet) and acetyl methyl at 2.09 (singlet) indicating formation of acetoxy bromide. Concentration of the reaction mixture containing 107a and 107b and saponification with $\mathrm{K}_{2} \mathrm{CO}_{3}$ in dry MeOH resulted in deacetylation followed by concomitant cyclization to furnish the trans-epoxide 74 (posticlure) in $88 \%$ yield. This stereospecific one-pot epoxidation sequence involved the first inversion at the bromide-receiving center followed by a second inversion at the bromide-leaving center to give the trans-epoxide. Thus, this transformation resulted in overall retention of configuration and therefore the regioselectivity of the acetyl bromide formation is immaterial.

(-)-posticlure 74

(+)-posticlure 74b

Scheme 19. Reaction conditions: (i) $\mathrm{CH}_{3} \mathrm{C}(\mathrm{OMe})_{3}, p-\mathrm{TsOH}$ (cat), $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rt}, 30 \mathrm{~min}$. (ii) $\mathrm{CH}_{3} \mathrm{COBr}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, rt, 4 h. (iii) $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{MeOH}, \mathrm{rt}, 8 \mathrm{~h}, 86-88 \%$ overall.

Posticlure 74 had $[\alpha]_{D}{ }^{20}-11.1\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$ which is in accordance to literature value of $[\alpha]_{\mathrm{D}}{ }^{24}-10.8\left(\mathrm{c}=1.07, \mathrm{CHCl}_{3}\right) .{ }^{29 \mathrm{a}}(-)$-Posticlure 74 was fully characterized by IR, ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, EIMS and elemental analysis. The IR spectrum of (-)-74 showed olefin peaks at 1725 and $1708 \mathrm{~cm}^{-1}$. In the ${ }^{1} \mathrm{H}$ NMR spectrum of $(-)-74$ the epoxide protons appeared at $\delta 2.82$ (doublet of triplet) with coupling constant of $J=2.1 \mathrm{~Hz}, 3.36$ (doublet of doublet) with $J=2.1,8.7 \mathrm{~Hz}$. The coupling constant of $J=2.1 \mathrm{~Hz}$ indicates the trans-epoxide functionality. The olefinic protons appeared at $\delta 5.08$ (doublet of doublet of doublet, 1 proton), 5.37 (doublet of triplet of triplet, 1 proton), 5.44 (doublet of triplet of triplet, 1 proton), and 5.67 (doublet of triplet, 1 proton). The chemical shifts and coupling constants for epoxide protons and olefin protons matched well with the reported data ${ }^{27}$ (Figure 6). The EIMS showed a distinct molecular ion peak at $\mathrm{m} / \mathrm{z} 306$. Also diagnostic peaks at $m / z 209,195,179,155$ and 136 matched well with the reported data of natural posticlure ${ }^{27}$ (Figure 7).

Figure 6. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) spectrum of synthetic (-)-posticlure 74. For ${ }^{1} \mathrm{H}$ NMR spectrum of natural posticlure 74, see ref. 27.

Figure 7. EIMS of synthetic (-)-posticlure 74. For EIMS of natural posticlure 74 see ref. 27.
In a similar way, the diol 103 was converted into the unnatural antipode (+)-posticlure 74b in $86 \%$ yield, having $(11 R, 12 R)$ configuration and $[\alpha]_{D}{ }^{20}+11.33\left(\mathrm{c}=2, \mathrm{CHCl}_{3}\right)\left[\right.$ lit. $[\alpha]_{\mathrm{D}}{ }^{24}+10.9$ $\left.\left(\mathrm{c}=1.09, \mathrm{CHCl}_{3}\right)\right] .{ }^{29 \mathrm{a}}$ The spectral details are the same as described for $(-)-74$.

## Determination of enantiomeric purity:

To determine the enantiomeric purity of both natural and unnatural posticlure prepared by the above synthetic strategy, the compounds 93 and 101 having free hydroxyl groups were chosen for analysis. The free hydroxyl group of $\mathbf{9 3}$ and $\mathbf{1 0 1}$ were converted into their Mosher esters with $(S)$-(+)-2-methoxy- $\alpha$-trifluoromethylphenylacetylchloride and DMAP in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solvent to give 108 and 109 respectively. The diastereomers 108 and 109 were analyzed by ${ }^{19} \mathrm{~F}$ NMR separately.

For comparison, both $\mathbf{1 0 8}$ and $\mathbf{1 0 9}$ were mixed in equal amounts and analyzed for separation in ${ }^{19} \mathrm{~F}$ NMR spectrum. The ${ }^{19} \mathrm{~F}$ NMR spectra for 108, mixture and 109 are given in Figure 8. Analysis of these ${ }^{19} \mathrm{~F}$ NMR spectra indicated an enantiomeric excess of $>99 \%$.

Figure 8. ${ }^{19}$ F NMR spectra of Mosher esters $\mathbf{1 0 8}$, racemate $(\mathbf{1 0 8}+\mathbf{1 0 9 )}$ and 109

### 4.3.5. Conclusion

Posticlure is a novel first trans-epoxide pheromone in the class of epoxides identified as attractant pheromones. Wakamura et al. have synthesized both isomers in $59 \%$ ee by employing the SAE reaction and obtained the pure material by preparative HPLC. However, we have employed an alternative sequence of reactions to SAE involving a two-step process, SAD and stereospecific one-pot epoxidation. Although two steps, it is much more compatible in terms of both yields and enantioselectivity. Thus, a highly enantioselective synthesis of the first novel trans-epoxide pheromone posticlure has been achieved on a large-scale. ${ }^{36}$ The natural posticlure having $(11 S, 12 S)$ configuration has been identified to possess the negative optical rotation. The unnatural isomer (+)-posticlure has also been synthesized. This alternative route will provide an easy excess to large-scale synthesis of both $(-)$ - and (+)-posticlure for biological studies and pest control.

### 4.3.6. Experimental

## General information

Solvents were purified and dried by standard procedures before use. Petroleum ether of boiling range $60-80^{\circ} \mathrm{C}$ was used. Melting points are uncorrected. Optical rotations were measured using sodium D line on a JASCO P-1020 microprocessor based polarimeter. Infrared spectra were recorded on ATI MATTSON RS-1 FT-IR spectrometer. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Bruker AC-200 spectrometer or Bruker 500 MHz spectrometer as indicated with residual $\mathrm{CHCl}_{3}$ as internal standard ( $\delta 7.27{ }^{1} \mathrm{H}$ NMR and $\delta 77.00{ }^{13} \mathrm{C}$ NMR). Mass spectra were obtained with a TSQ 70, Finningen MAT mass spectrometer. Elemental analyses were carried out on a Carlo Erba CHNS-O analyzer.

## Preparation of ethyl trans-dodec-2-enoate, 90

To a solution of (ethoxycarbonylmethylene)triphenylphosphorane ( $12.2 \mathrm{~g}, 35 \mathrm{mmol}$ ) in dry THF ( 100 mL ) was added decanal $89(5 \mathrm{~g}, 32 \mathrm{mmol})$ in THF ( 10 mL ). The reaction mixture was stirred at room temperature for 12 h and then concentrated. To the residue was added ether and the precipitated solids of triphenylphosphine oxide were filtered off and washed with ether. The filtrate was concentrated and the residue was purified by silica gel column chromatography using petroleum ether:EtOAc (9:1) to give $\mathbf{9 0}(6.23 \mathrm{~g})$ as a colorless oil.

Yield: $6.23 \mathrm{~g}, 86 \%$
IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\text {max }} 1724,1656,1465$
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 0.86,(\mathrm{t}, J=6.5 \mathrm{~Hz}, 3 \mathrm{H}), 1.2-1.26(\mathrm{~m}, 12 \mathrm{H}), 1.3(\mathrm{t}, J=8 \mathrm{~Hz}$, $3 \mathrm{H}), 1.5(\mathrm{~m}, 2 \mathrm{H}), 2.19\left(\mathrm{brq}, J_{\text {allylic }}=7,2 \mathrm{~Hz}, 2 \mathrm{H}\right), 4.18(\mathrm{q}, J=8 \mathrm{~Hz}, 2 \mathrm{H}), 5.76\left(\mathrm{dt}, J_{\text {trans }}=16 \mathrm{~Hz}\right.$, $2 \mathrm{~Hz}, 1 \mathrm{H}), 6.95\left(\mathrm{dt}, J_{\text {trans }}=16 \mathrm{~Hz}, J_{\text {allylic }}=7 \mathrm{~Hz}, 1 \mathrm{H}\right)$
${ }^{13} \mathbf{C}$ NMR ( $50 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 13.38,13.56,22.23,27.67,28.48,28.77,29.03,31.49,31.75$, 59.4, 120.93, 148.53, 165.84

EIMS $\boldsymbol{m} / \boldsymbol{z}$ (relative intensity, \%): $226\left[\mathrm{M}^{+}\right]$(2.4), 197 (1.4), 181 (19.7). 155 (5.8), 127 (20.4), 101 (36), 81 (45.6), 68 (36.7), 55 (100).

Analysis: $\mathrm{C}_{14} \mathrm{H}_{26} \mathrm{O}_{2}(226.35)$ requires $\mathrm{C}, 74.28 ; \mathrm{H}, 11.57$. Found: C, $74.46 ; \mathrm{H}, 11.32$.

## Synthesis of (2R,3S)-ethyl-2,3-dihydroxydodecanoate, 91

91
To a mixture of $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}(13.06 \mathrm{~g}, 39.76 \mathrm{mmol}), \mathrm{K}_{2} \mathrm{CO}_{3}(5.49 \mathrm{~g}, 39.76 \mathrm{mmol})$ and $(\mathrm{DHQ})_{2}$ PHAL ( $104 \mathrm{mg}, 0.133 \mathrm{mmol}, 1 \mathrm{~mol} \%$ ) in $t-\mathrm{BuOH}: \mathrm{H}_{2} \mathrm{O}(1: 1,140 \mathrm{~mL})$ cooled at $0^{\circ} \mathrm{C}$ was added osmium tetroxide (536 $\mu \mathrm{L}, \quad 0.1 \mathrm{M}$ solution in toluene, $0.4 \mathrm{~mol} \%$ ) followed by methanesulfonamide $(1.26 \mathrm{~g}, 13.25 \mathrm{mmol})$. After stirring for 5 min at $0^{\circ} \mathrm{C}$, the olefin $90(3 \mathrm{~g}$, 13.25 mmol ) was added in one portion. The reaction mixture was stirred at $0^{\circ} \mathrm{C}$ for 24 h and then quenched with solid sodium sulfite ( 5 g ). The stirring was continued for an additional 45 min and then the solution was extracted with EtOAc $(5 \times 30 \mathrm{~mL})$. The combined organic phases were washed with $10 \%$ aq KOH , brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. Silica gel column chromatography of the crude product using petroleum ether:EtOAc (3:2) as eluent gave 91 (3.24 g) as a white solid.

Yield: $3.24 \mathrm{~g}, 94 \%$
Мр.: $52-53^{\circ} \mathrm{C}$

Analysis: $\mathrm{C}_{15} \mathrm{H}_{30} \mathrm{O}_{3}$ (258.4) requires $\mathrm{C}, 69.72 ; \mathrm{H}, 11.70$. Found: $\mathrm{C}, 69.63 ; \mathrm{H}, 11.82$.

## Preparation of cis-3-nonen-1-iodide, 95

To a solution of triphenylphosphine ( $13.72,52.3 \mathrm{mmol}$ ) in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50 \mathrm{~mL})$ was added iodine ( $13.27,52.3 \mathrm{mmol}$ ). The orange precipitate was stirred for 30 min and a solution of cis-3-nonen-1-ol 94 ( $6.2 \mathrm{~g}, 43.58$ ) and imidazole ( $3.56,52.3 \mathrm{mmol}$ ) was added dropwise. The reaction mixture was stirred at room temperature for 1.5 h and then $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was evaporated. The residue was diluted with water and the solution was extracted with EtOAc $(3 \times 50 \mathrm{~mL})$. The combined organic extracts were washed with $20 \%$ aq. $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$, brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. The residue was purified by silica gel column chromatography using petroleum ether:ether (9.8:0.2) to give cis-3-nonen-1-iodide $95(10.77 \mathrm{~g})$ as colorless oil.

Yield: 10.77, $98 \%$
IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max }$ 1648, 1457

## Preparation of cis-3-nonenetriphenylphosphoniumiodide, 96

To a solution of triphenylphosphine ( $10.4 \mathrm{~g}, 39.65 \mathrm{mmol}$ ) in dry benzene ( 50 mL ) was added the iodide 95 ( $10 \mathrm{~g}, 39.65 \mathrm{mmol}$ ) and the solution refluxed for 24 h . The reaction mixture was cooled to room temperature and benzene removed under reduced pressure. The sticky solid was triturated with dry $\mathrm{Et}_{2} \mathrm{O}$ to remove unreacted starting materials. The residue was dried under high vacuum to a white sticky solid of cis-3-nonenetriphenylphosphoniumiodide 96 (19.4 g, 95\%) and was used as such immediately.

## Synthesis of (6Z,9Z,11S,12S)-11,12-O-isopropylidenehenicosa-6,9-diene, 97

To a solution of oxalyl chloride ( $5.89 \mathrm{~g}, 4.05 \mathrm{~mL}, 46.42 \mathrm{mmol}$ ) in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(250 \mathrm{~mL})$ cooled at $-78^{\circ} \mathrm{C}$ was added dropwise DMSO ( $6.6 \mathrm{~mL}, 92.84 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{~mL})$ over 20 min . The reaction mixture was stirred for 30 min at $-78^{\circ} \mathrm{C}$ and the solution of alcohol $93(8 \mathrm{~g}$, $30.95 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{~mL})$ was added dropwise at $-60^{\circ} \mathrm{C}$ over 20 min . The reaction mixture was stirred for 30 min when a copious white precipitate was obtained. $\mathrm{Et}_{3} \mathrm{~N}(16 \mathrm{~mL})$ was added dropwise and stirred for 1 h allowing the temperature to rise to room temperature. The reaction mixture was quenched with $2 \%$ aq. $\mathrm{HCl}(200 \mathrm{~mL})$ and the new phase extracted with EtOAc. The combined organic phases were washed (brine), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated to give the crude aldehyde, which was used in the next step without further purification.

To a stirred suspension of the Wittig salt $96(19.4 \mathrm{~g}, 37.7 \mathrm{mmol})$ in dry THF ( 100 mL ) was added $n$ - BuLi ( $20 \mathrm{~mL}, 40 \mathrm{mmol}, 2 \mathrm{M}$ in hexane) dropwise at $0^{\circ} \mathrm{C}$. The reaction mixture was stirred till all solids dissolved ( 30 min ). To the dark red solution was added the above aldehyde in dry THF ( 20 mL ) dropwise at $-80^{\circ} \mathrm{C}$. The reaction was stirred for 8 h at $-80^{\circ} \mathrm{C}$ and then allowed to warm to room temperature. It was quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}$ and extracted with $\mathrm{EtOAc}(3 \times 50 \mathrm{~mL})$. The combined organic layers were washed (brine), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. The residue was purified by silica gel column chromatography using petroleum ether: $\mathrm{EtOAc}(9: 1)$ as eluent to give $97(8.58 \mathrm{~g})$ as colorless oil.
Yield: $8.58 \mathrm{~g}, 76 \%$

## Synthesis of $(6 Z, 9 Z, 11 E)$-henicosatriene, 105

To a stirred suspension of PCC $(11.76,54.55 \mathrm{mmol})$ and powdered molecular sieves $\left(3 \mathrm{~A}^{\circ}, 4\right.$ $\mathrm{g})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(200 \mathrm{~mL})$ was added $104(6.7 \mathrm{~g}, 36.35 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$. The reaction mixture was stirred at room temperature for 8 h and then concentrated. The residue was triturated with ether, filtered through a pad of celite and washed with ether $(3 \times 50 \mathrm{~mL})$. The filtrate was concentrated to give virtually pure aldehyde ( $5.62 \mathrm{~g}, 85 \%$ ) as colorless oil. This was used as such in subsequent reaction.

To a suspension of the Wittig salt 96 ( $19.4 \mathrm{~g}, 37.7 \mathrm{mmol}$ ) in dry THF ( 100 mL ) was added LiHMDS ( $45 \mathrm{~mL}, 45 \mathrm{mmol}, 1 \mathrm{M}$ soln. In THF) dropwise at $0^{\circ} \mathrm{C}$. The reaction mixture was stirred till all solids dissolved ( 30 min ). To the dark red solution was added the above aldehyde in dry THF ( 20 mL ) dropwise at $-80^{\circ} \mathrm{C}$. The reaction was stirred for 8 h at $-80^{\circ} \mathrm{C}$ and then allowed to warm to room temperature. It was quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}$ and extracted with EtOAc $(3 \times 50 \mathrm{~mL})$. The combined organic layers were washed (brine), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. The residue was purified by silica gel column chromatography using petroleum ether:ether (99:1) as eluent to give $\mathbf{1 0 5}(7.81 \mathrm{~g})$ as a colorless oil.

Yield: $7.81 \mathrm{~g}, 74 \%$
IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max } 1680,1642,1465 \mathrm{~cm}^{-1}$
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 0.89(\mathrm{~m}, 6 \mathrm{H}), 1.25-1.3(\mathrm{~m}, \mathbf{2 0 H}), 2.01-2.22(\mathrm{~m}, 6 \mathrm{H}), 5.38-5.63$ (m, 4H), $5.99(\mathrm{~m}, 1 \mathrm{H}), 6.24(\mathrm{dd}, J=15,4 \mathrm{~Hz}, 1 \mathrm{H})$
${ }^{13} \mathbf{C}$ NMR ( $50 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 13.96,14.07,22.27,22.78,29.36,29.47,29.66,31.53,32.01$, $32.34,32.71,33,34.8,125.81,128.98,129.49,130.48,130.81,134.53$.
EIMS $\boldsymbol{m} / \boldsymbol{z}$ (relative intensity, \%): $290\left[\mathrm{M}^{+}\right]$(3.3), 247 (1.3), 193 (2.6), 109 (14.4), 95 (34.6), 81 (56.2), 67 (100), 55 (78.4)

Analysis: $\mathrm{C}_{21} \mathrm{H}_{38}$ (290.53) requires C, 86.81; H, 13.18 Found: C, 87.01; H, 12.98

## Monodihydroxylation of triene 105 to 98

To a mixture of $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}(3.4 \mathrm{~g}, 10.33 \mathrm{mmol}), \mathrm{K}_{2} \mathrm{CO}_{3}(1.43 \mathrm{~g}, 10.33 \mathrm{mmol})$ and $(\mathrm{DHQ})_{2}$-PHAL ( $27 \mathrm{mg}, 0.0344 \mathrm{mmol}, 1 \mathrm{~mol} \%$ ) in $t-\mathrm{BuOH}-\mathrm{H}_{2} \mathrm{O}(1: 1,40 \mathrm{~mL})$ cooled at $0^{\circ} \mathrm{C}$ was
added osmium tetroxide ( $68 \mu \mathrm{~L}, \quad 0.1 \mathrm{M}$ solution in toluene, $0.2 \mathrm{~mol} \%$ ) followed by methanesulfonamide $(0.327 \mathrm{~g}, 3.44 \mathrm{mmol})$. After stirring for 5 min at $0^{\circ} \mathrm{C}$, the triene $\mathbf{1 0 5}(1 \mathrm{~g}$, $3.44 \mathrm{mmol})$ was added in one portion. The reaction mixture was stirred at $0^{\circ} \mathrm{C}$ for 10 h and then quenched with solid sodium sulfite $(5 \mathrm{~g})$. The stirring was continued for an additional 45 min and then the solution was extracted with EtOAc $(5 \times 30 \mathrm{~mL})$. The combined organic phases were washed with $10 \%$ aq. KOH , brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. Silica gel column chromatography of the crude product using petroleum ether:EtOAc (3:2) as eluent gave 98 (0.87 g) as colorless syrup.

Yield: $0.87 \mathrm{~g}, 78 \%$
$[\alpha]_{\underline{D}}{ }^{20}:-5.69\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$.

## Monodihydroxylation of triene 105 to 103

In this case (DHQD) $)_{2}$-PHAL ligand was used. Following the above procedure, $\mathbf{1 0 5}$ gave $\mathbf{1 0 3}$ as colorless syrup.

Yield: $0.89 \mathrm{~g}, 79 \%$
$[\alpha]_{\underline{D}}{ }^{\mathbf{2 0}}:+5.81\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)$

## Synthesis of (-)-posticlure, 74

To solution of diol $98\left(0.8 \mathrm{~g}, 2.46 \mathrm{mmol}\right.$ ), and $p$ - $\mathrm{TsOH}(8 \mathrm{mg})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ was added trimethylorthoacetate $(0.385 \mathrm{~g}, 3.2 \mathrm{mmol})$ and stirred at room temperature for 30 min . The solvent was evaporated and the residual methanol was removed under high vacuum. The residue was taken in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ and acetyl bromide $(0.237 \mathrm{~mL}, 3.2 \mathrm{mmol})$ was added dropwise a room temperature. The reaction mixture was stirred for 4 h and concentrated to give a mixture of virtually pure acetoxy bromides 107 a and 107b.

${ }^{\mathbf{1}} \mathbf{H}$ NMR ( $200 \mathbf{~ M H z}, \mathbf{C D C l}_{3}$ ): $\delta 0.88(\mathrm{~m}, 6 \mathrm{H}), 1.2-1.35(\mathrm{~m}, 20 \mathrm{H}), 1.67(\mathrm{~m}, 2 \mathrm{H}), 2.06(\mathrm{~m}, 2 \mathrm{H})$, 2.09 (s, 3H), 2.87 (br t, $J=7 \mathrm{~Hz}, 2 \mathrm{H}$ ), $4.96(\mathrm{~m}, 1 \mathrm{H}), 5.09(\mathrm{~m}, 1 \mathrm{H}), 5.4-5.75(\mathrm{~m}, 4 \mathrm{H})$

EIMS $\boldsymbol{m} / \boldsymbol{z}$ (relative intensity, \%): $429\left[\mathrm{M}^{+}\right](0.3), 369$ (0.7), 349 (0.5), 307 (6.6), 289 (11.9), 195 (4.6), 155 (15.5), 109 (13.2), 95 (29.8), 81 (47.7), 67 (56.3), 55 (100)

To the mixture of $\mathbf{1 0 7 a}$ and $\mathbf{1 0 7} \mathbf{b}$ was added dry $\mathrm{MeOH}(4 \mathrm{~mL})$ and powdered $\mathrm{K}_{2} \mathrm{CO}_{3}(0.443$ $\mathrm{g}, 3.2 \mathrm{mmol}$ ) and stirred for 4 h at room temperature. The reaction mixture was filtered through a pad of neutral alumina and the pad washed with $\mathrm{Et}_{2} \mathrm{O}(3 \times 50 \mathrm{~mL})$. The filtrate was concentrated and the residue purified by silica gel column chromatography using petroleum ether:ether (9:1) as eluent to give $(-)-74(0.665 \mathrm{~g})$ as colorless oil.

Yield: $0.665 \mathrm{~g}, 88 \%$
$[\alpha]_{\mathrm{D}}{ }^{\mathbf{2 0}}:-11.1\left(\mathrm{c}=1, \mathrm{CHCl}_{3}\right)\left[\text { lit. }[\alpha]_{\mathrm{D}}{ }^{24}-10.8\left(\mathrm{c}=1.07, \mathrm{CHCl}_{3}\right)\right]^{29 \mathrm{a}}$

## CHAPTER 5

A NEW PCC MEDIATED UNUSUAL C-C BOND CLEAVAGE DURING OXIDATION OF HOMOBENZYLIC ALCOHOLS LEADING TO BENZYLIC CARBONYL COMPOUNDS

### 5.1. Introduction

Until the studies of Corey and co-workers, the reactivity of pyridinium chlorochromate (PCC 1) had little been investigated; therefore little data is available in the literature before 1975. The first report on the chlorochromate anion dates back to 1833 , when the preparation of potassium chlorochromate was described by Peligot. ${ }^{1,2}$ Subsequently only two modified versions of this method have been reported, ${ }^{3,4}$ and in 1899 , the first synthesis of PCC was achieved. ${ }^{5}$

The search for mild, versatile and selective reagents for the operationally simple oxidation of alcohols to carbonyl compounds has long been the objective of many research laboratories. Many reagents containing the chromium (VI) ion have been studied, ${ }^{6}$ but a large number of them cannot be conveniently used in the modern organic synthesis, especially for the oxidation or preparation of complex or highly sensitive substances. The most popular of them, the Collins reagent, showed several difficulties. The $\mathrm{CrO}_{3} /$ pyridine complex must be used in large excess (5 or 6 mol-equivalents), it is unstable, hygroscopic, and it is prepared by a dangerous procedure, during which it can ignite spontaneously. Finally, it shows a poor selectivity in the oxidation of primary alcohols to aldehydes. ${ }^{7}$ The studies of Corey and co-workers ${ }^{8}$ arose both from the foregoing remarks and from the need to improve the selectivity and effectiveness of the oxidant species.

The first advantage of PCC is that it is prepared easily and safely. ${ }^{8}$ The addition of $\mathrm{CrO}_{3}$ to 6 N HCl furnishes the unstable chlorochromic acid and subsequent addition of pyridine at $0^{\circ} \mathrm{C}$ immediately gives PCC 1 (Scheme 1) as a yellow-orange solid which is not appreciably hygroscopic.

1

Scheme 1. Preparation of PCC.

The second advantage is that it shows a high capability to convert primary alcohols exclusively to aldehydes with greater efficiency. PCC shows a slightly acidic character and for acid-labile groups the reaction could be buffered with NaOAc .

## Mechanism of the reaction:

There are only a very few, non-homogeneous reports on the reaction mechanism of pyridinium chlorochromate. ${ }^{9-14}$ Banerji ${ }^{9}, 10,11$ has studied the kinetics of the oxidation by pyridinium chlorochromate of several primary aliphatic and aromatic alcohols. On the basis of experimental data, two different pathways ( $\mathbf{A}$ and $\mathbf{B}$ ) can be proposed. ${ }^{9,10}$

Path A:

## Path B:

Furthermore, a stoichiometry in which a three-electron change is involved was proposed, whereby the oxidant, $\mathrm{Cr}(\mathrm{VI})$, is reduced to Cr (III).

More recently, Brown et al. ${ }^{14}$ have also examined the stoichiometry of this oxidation. The alcohols were oxidized by the Corey ${ }^{8}$ procedure utilizing the theoretical amount of PCC and it was proposed that the reaction could involve the transfer of only two electrons.

### 5.2. Review of Literature

PCC is a well-known reagent for oxidation of primary and secondary alcohols to carbonyl compounds with high efficiency. ${ }^{7}$ Corey et al. ${ }^{8}$ carried out oxidations of several primary and secondary alcohols to carbonyl compounds in high yields (Table 1).

Table 1.

| Alcohol | Product | Yield \% |
| :--- | :--- | :---: |
| 1-Decanol 11 | Decanal $\mathbf{1 7}$ | 92 |
| 1,6-Hexanediol 12 | Hexanedial $\mathbf{1 8}$ | 68 |
| Benzhydrol $\mathbf{1 3}$ | Benzophenone $\mathbf{1 9}$ | 100 |
| Oct-2-yn-1-ol $\mathbf{1 4}$ | Oct-2-ynal $\mathbf{2 0}$ | 84 |
| Citronellol $\mathbf{1 5}$ | Citronellal $\mathbf{2 1}$ | 82 |
| $(Z) \mathrm{HOCH}_{2} \mathrm{CH}=\mathrm{CHCH}_{2} \mathrm{OTHP} \mathbf{1 6}$ | $($ E $)$ OHCCH=CHCH $2 \mathrm{OTHP} \mathbf{2 2}$ | 81 |

Corey ${ }^{15}$ took advantage of both the oxidant power and the acidic nature of PCC to bring about an essentially one-step conversion of (-)-citronellol 23 to (-)-pulegone 26, ${ }^{15}$ an important intermediate in the asymmetric synthesis of prostaglandins ${ }^{16,17}$ (Scheme 2).

Babler and Coghlan ${ }^{18}$ and Sundararaman and $\mathrm{Herz}^{19}$ have shown that the oxidant and slightly acidic character of PCC is able to convert allylic tertiary alcohols into $\alpha, \beta$-unsaturated aldehydes (Table 2). Similarly, Dauben et al. ${ }^{20}$ have shown that tertiary vinyl alcohols can be oxidized by PCC to transposed 3-alkyl $\alpha, \beta$-unsaturated carbonyl compounds in excellent yields (Table 2).

## Table 2.

| Substrate |  | Product | Yield \% | Reference |
| :--- | :--- | :--- | :--- | :--- |
| 27 |  |  | 8 | 18 |

(29)

Piancatelli and co-workers ${ }^{21}$ used PCC in the oxidation of 5-methyl-2-( $\alpha$-hydroxyalkyl)furans (37) to 6-hydroxy-2H-pyran-3-(6H)-ones (38). Thus, PCC showed an unusual behavior as dienophile and oxidant in the ring enlargement of 2-furylcarbinols to pyran derivatives (Scheme 3).

Scheme 3
Piancatelli et al. ${ }^{22}$ subsequently reported oxidation of linear and cyclic enol-ethers to esters and lactones by using PCC (Table 3). The reagent behaves as an oxidizing, weakly electrophilic species, capable of attacking particularly nucleophilic olefins, such as olefin ethers.

Table 3.

| Enol-ether | Product | Yield \% |
| :--- | :--- | :---: |
| 5-cholesten-3 $\beta$-vinyl-ether 39 | Cholesteryl-3 $\beta$-acetate 40 | 95 |
| Ethyl-vinyl-ether 41 | Ethylacetate 42 | 75 |
| 2,3-dihydro-4H-pyran 43 | $\delta$-valerolactone 44 | 90 |
| 2,3-dihydrofuran 45 | $\gamma$-butyrolactone 46 | 85 |

Maloney et al. ${ }^{23}$ have achieved the deoxamination of oximes to regenerate the carbonyl compound by using PCC. In contrast, Drabowicz ${ }^{24}$ found that the $\mathrm{PCC} / \mathrm{H}_{2} \mathrm{O}_{2}$ system was more effective as a deblocking agent and the reactions proceeded within 10 min at $010^{\circ} \mathrm{C}$ when $30 \%$ $\mathrm{H}_{2} \mathrm{O}_{2}$ was added to an acetone solution of the oxime and PCC (Scheme 4).

Wender et al. ${ }^{25}$ have found that PCC can oxidize 1,4 -dienes to dienones. The chemoselectivity is noteworthy, as it does not affect oxidation of isolated double bonds or more reactive systems such as diphenylmethane and allyl benzene. Thus, oxidation of $\mathbf{4 9}$ gave 50 and 51 in 9:1 ratio. Similarly, Marshall and Wuts ${ }^{26}$ reported the oxidation of $\mathbf{5 2}$ with PCC to ester aldehyde 53 along with the product of allylic oxidation, the dienone aldehyde 54 (Scheme 5 ).

Brown et al. ${ }^{27}$ have reported the synthesis of aldehydes by PCC oxidation of trialkylboranes (56), derived by the hydroboration of 1-alkenes (Scheme 6).

Subsequently, Brown and co-workers ${ }^{28}$ reported the synthesis of carbonyl compounds by PCC oxidation of borate esters (59) (Scheme 7).

Scheme 7

In a subsequent report by the same authors, ${ }^{29}$ the efficient conversion of carboxylic acids into aldehydes was described via oxidation of intermediate boroxines ( $\mathbf{6 2}$ ) obtained by the reaction of carboxylic acids with diborane (Scheme 8).

Scheme 8
Nakai et al. ${ }^{30}$ carried out PCC oxidation of tertiary 2-alkyl cyclopropylcarbinols to the transposed $\beta, \gamma$-enones via homoallylic rearrangement, making the overall process a synthetically useful method for 1,4-carbonyl transposition (Scheme 9).

Scheme 9
Brown et al. ${ }^{31}$ reported highly selective conversion of terminal olefins into aldehydes. The selectivity is achieved via selective hydroboration of the terminal olefin with disiamyl borane (Scheme 10).

Scheme 10

Rollin and Sinay ${ }^{32}$ demonstrated a convenient one-step oxidation of glycals to lactones using PCC (Scheme 11).

Scheme 11
Miller and co-workers ${ }^{33}$ showed the high capability of PCC to release quinone from hydroquinone silyl ethers by a simple and efficient procedure (Scheme 12).

Scheme 12
A number of vicinal diols have been oxidatively cleaved by PCC to give good yields of the corresponding aldehydes or ketones under mild conditions (Table 4). ${ }^{34}$
Table 4.

| Substrate | Product | Yield \% |
| :--- | :--- | :---: |

Fetizon et al. ${ }^{37}$ reported that the allylic alcohols (98) obtained from lithiated 1,4-dioxene and ketones or aldehydes undergo regiospecific oxidative cleavage with PCC at the dioxene double bond to give, after saponification, $\alpha$-hydroxy acids (101). Extension of this reaction to $\alpha, \beta$ unsaturated ketones (102) afforded $\alpha$-keto acids (104) (Scheme 13).

PCC in refluxing $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ has been found to be an effective reagent for allylic and benzylic oxidations of activated methylene groups to yield the corresponding unsaturated ketones ${ }^{38}$ (Scheme 14).

Scheme 14
Similarly, butenolide and benzofuranone are conveniently prepared by PCC oxidation of active methylene compounds in the presence of pyridine in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (Scheme 15). ${ }^{39}$

Scheme 15
Cossy et al. ${ }^{40}$ carried out specific oxidative cleavage of allylic and benzylic ethers by using PCC (Scheme 16).

Scheme 16.

### 5.3. Present Work

## objective

PCC is a well-known oxidizing agent, for conversion of alcohols to aldehydes and ketones with high efficiency. Several rearrangements and useful conversions are mediated by PCC. This makes PCC a versatile oxidant (reagent) in organic synthesis. The present work in our laboratory is an accidental finding that PCC in excess oxidizes the homobenzylic alcohols to benzylic carbonyl compounds. Thus, the objective of the present investigation is to explore the following possibilities.

1. To generalize the C - C bond breaking reaction on several homobenzylic alcohols with no benzylic substitution, such that the end product of this oxidation would be a benzylic aldehyde.
2. To generalize this $\mathrm{C}-\mathrm{C}$ bond breaking reaction on several homobenzylic alcohols with benzylic substitution, such that the end product of this oxidation would be an aryl ketone.
3. To explore the similar reaction on homoallylic alcohols, in order to investigate the course of reaction as there could be ample opportunity of double bond migration and/or allylic oxidation.

### 5.4. Results and Discussion

In our synthetic endeavor on the total synthesis of anticcocidial antibiotic (+)-Diolmycin $\mathrm{A} 2,{ }^{41}$ we were in need of 2-(4-benzyloxyphenyl)acetaldehyde 118. Swern oxidation of 2-(4benzyloxyphenyl)ethanol 117 gave 2-(4-benzyloxyphenyl)acetaldehyde 118. To ease the workup procedure involving odorous dimethylsulfide, we carried out PCC oxidation. Surprisingly, this oxidation with 1.5 equivalents of PCC gave a $75: 25$ mixture of 4-benzyloxybenzaldehyde 119 and the expected 2-(4-benzyloxyphenyl)acetaldehyde 118 respectively (Scheme 17 ).

Scheme 17.
Thus, there is scission of GC bond leading to loss of one carbon atom and yet, to add to our enthusiasm, the end product is still a benzylic aldehyde without further oxidation. The product mixture was confirmed by ${ }^{1} \mathrm{H}$ NMR spectrum where the benzylic methylene of $\mathbf{1 1 8}$ was rudimentary. The aldehyde proton of $\mathbf{1 1 9}$ was a sharp singlet above $\delta 10.00$ indicating a benzylic aldehyde, while a rudimentary triplet was obtained below $\delta 10.00$ indicating a small amount of homobenzylic aldehyde 118. Thus, this degradative oxidation involving $\mathrm{C}-\mathrm{C}$ bond cleavage adds to one of the novel and new oxidation reactions of PCC.

Aimed at achieving a better understanding of this new oxidation reaction of PCC, we subjected varied homobenzylic alcohols with no benzylic substitution (Table 7) to PCC oxidation. Initial experiments with 1.5 equivalents of PCC gave a small amount of homobenzylic aldehyde, but the major product was benzylic aldehyde (entry 1 and 3, Table 7). However when the oxidation was carried out with 3 equivalents of PCC, only benzylic aldehyde was obtained. Thus, varied homobenzylic alcohols with no benzylic substitution, irrespective of aryl ring substituents, on oxidation with 3 equivalents of PCC gave the benzylic aldehydes in moderate to good yields. The novelty lies in the fact that although one carbon is lost, still an aldehyde is obtained without further oxidation to an acid. The product was isolated in pure form without the need for further purification beyond mere filtration and concentration.

$\mathrm{R}=\mathrm{H}, \mathrm{Cl}, \mathrm{Br}, \mathrm{OMe}, \mathrm{OCH}_{2} \mathrm{Ph}, \mathrm{Ar}, \ldots .$.

To understand better the scope of this oxidation reaction, we extended the reaction to homobenzylic alcohols with benzylic substitution such that the end product could be a aryl ketone. The simplest substrate available was 2-phenyl-1-propanol (obtained by hydroboration reaction on $\alpha$-methylstyrene) where the reaction should yield acetophenone as an expected product. Indeed the PCC oxidation of 2-phenyl-1-propanol initially with 1.5 equivalents of PCC gave a 9:1 mixture of acetophenone and 2-phenyl-1-propanal respectively (entry 1, Table 8). However, with 3 equivalents of PCC only acetophenone was obtained (entry 2, Table 8). Thus, varied homobenzylic alcohols with benzylic alkyl/aryl substitution, on oxidation with 3 to 4 equivalents of PCC gave only the aryl ketones in good yields (Table 8). Another noteworthy observation is that although PCC is known for oxidation of benzylic and active methylene compounds, no oxidation of benzylic methylene was observed for entry 8 and 9 , indicating the need of reflux conditions as reported in the literature. ${ }^{38}$

## Mechanism of the reaction

A probable mechanism may involve a benzylic hydride abstraction from 156 leading to the formation of carbocation 157 , which is then trapped by the chlorochromate anion to produce 158 or $\mathbf{1 5 9}$, which breaks off to product 160 and Cr (VI), which in turn dismutates into Cr (III) and Cr (IV) species Scheme 18). However proving such a mechanism is beyond the scope of this investigation.

Scheme 18. Hypothetical mechanism for homobenzylic alcohol oxidation.

Encouraged by the results of CC bond cleavage during oxidation reaction mediated by PCC on homobenzylic alcohols, we aimed to study the same reaction on homoallylic alcohols. While allylic oxidation to $\alpha, \beta$-unsaturated carbonyl compounds is well known with PCC, the oxidation of homoallylic alcohols, where there is ample opportunity for double bond migration and/or allylic oxidation still remains to be explored. In order to investigate the course of reaction we carried out a detailed study of PCC oxidation on homoallylic alcohols. The results of this investigation are shown in Table 9.

Table 9. PCC oxidation of homoallylic alcohols.

| Entry | Substrate | Equiv. of PCC | React. time/h | Product | Isolated <br> Yield |
| :---: | :---: | :---: | :---: | :---: | :---: |

| :---: | :---: | :---: | :---: | :---: | :---: |

As shown in Table 9 (entry 1), PCC (3 equivalents) oxidation of 3-methyl-3-butene-1-ol (161) gave 3-methyl-2-butenal (162) in $68 \%$ yield as a result of alcohol oxidation and subsequent double bond migration. However oxidation of homoallylic alcohol $\mathbf{1 6 3}$ with PCC (3 equivalents) afforded a $1: 1$ mixture of $\mathbf{1 6 4}$ and $\mathbf{1 6 5}$ in $60 \%$ yield. Probably the oxidation of alcohol occurred first followed by double bond migration to give 164 and subsequent allylic/benzylic oxidation furnished 165. Similarly the oxidation of 166 gave a $1: 1$ mixture of 167 and 168. The isomerization of cis- to trans-olefin was observed in this case. The oxidation of long chain aliphatic cis-homoallylic alcohols gave clearly the products arising from alcohol oxidation, double bond migration with isomerization from cis- to trans- and allylic oxidation (entry 4-7). When the concentration of PCC was lowered from 3 equivalents to 1.5 equivalents (entry 7), a mixture of $\mathbf{1 7 2}$ and $\mathbf{1 7 5}$ was obtained. Thus, a one-pot conversion of homoallylic alcohols to 1,4-dicarbonyl- $2 E$-ene compounds is achieved with PCC.

### 5.5. Conclusion

To summarize, we have exploited a new and novel oxidation reaction by PCC involving CC bond cleavage during oxidation of homobenzylic alcohol to benzylic aldehyde or aryl ketone. This is one of the rare reactions of PCC where a degradation of one carbon occurs, and yet the end-product remains an aldehyde or ketone without further oxidation. Such a reaction will be very useful in analyzing functional group compatibilities in the design of oxidation reactions involving PCC. On the other hand, the homoallylic alcohols gave interesting results due to the double bond migration and concomitant cis- to trans-isomerization and/or allylic oxidation. Thus, this is a very useful conversion of homoallylic alcohols to 1,4 -dicarbonyl- $2 E$-ene compounds that may have a lot of potential as intermediates in organic synthesis.

### 5.6. Experimental

## General information:

The solvents were purified and dried by standard procedures before use. Petroleum ether of boiling range $60-80^{\circ} \mathrm{C}$ was used. Melting points are uncorrected. Infrared spectra were recorded on ATI MATTSON RS-1 FT-IR spectrometer. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR were recorded on Bruker AC-200 NMR spectrometer. Mass spectra were obtained with a Finnigan MAT- 1020 B-70 eV mass spectrometer. Elemental analyses were carried out on a Carlo Erba CHNS-O analyzer.

## Preparation of homobenzylic alcohols.

2-Phenyl ethanol (120) and most homoallylic alcohols were procured from commercial sources.

Most homobenzylic alcohols were prepared by either of the following process.

1. A two-step process, involving Wittig reaction on benzylic aldehydes or ketones to give the corresponding styrene compounds followed by hydroboration oxidation to the corresponding alcohols.
2. Some commercially available styrene compounds were directly subjected to hydroboration oxidation to give homobenzylic alcohols.

## General procedure for styrene preparation:

To a solution of the benzylic aldehyde or ketone ( 1 equivalent) in dry THF ( $1 \mathrm{~mL} / 2 \mathrm{mmol}$ ) was added the ylide generated from methyltriphenylphosphoniumiodide (1.2 equivalent) and NaHMDS ( 1 M soln in THF) or $n$ - BuLi ( 2 M soln in hexane) ( 1.4 equivalents) in THF (3 $\mathrm{mL} / \mathrm{mmol}$ ) at $0^{\circ} \mathrm{C}$. The reaction mixture was stirred at room temperature for $4-8 \mathrm{~h}$ and then quenched with aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution. The resulting solution was extracted with EtOAc. The EtOAc extracts were washed with brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. Column chromatography on silica gel using petroleum ether:EtOAc (95:5) gave the corresponding styrene compounds in $70-80 \%$ yields.

## General procedure for hydroboration oxidation of styrenes:

To a solution of styrene ( 1 equivalent) in dry THF ( $2 \mathrm{~mL} / \mathrm{mmol}$ ) was added $\mathrm{BH}_{3} . \mathrm{SMe}_{2}(2 \mathrm{M}$ solution in THF) (1.1 equivalents) at $0^{\circ} \mathrm{C}$. The reaction mixture was stirred at room temperature
for 4 h . It was cooled to $0^{\circ} \mathrm{C}$ and a solution of NaOH (2 equivalents) in $\mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O}(2: 1,2$ $\mathrm{mL} / \mathrm{mmol})$ was added followed by addition of $\mathrm{H}_{2} \mathrm{O}_{2}(30 \% \mathrm{w} / \mathrm{v}$ solution in water, 3 equivalents). It was then allowed to stir at room temperature for 4 h . The product was taken in EtOAc and the aqueous layer was extracted with EtOAc. The combined organic extracts were washed with brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. Column chromatography on silica gel using petroleum ether:EtOAc (4:1) as eluent gave the corresponding homobenzylic alcohol in 75-90\% yields.

## 2,2-Diphenyl ethanol, 151

White solid
Yield: 76\%
M.p.: $52-54^{\circ} \mathrm{C}$

IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max } 3381,1600,1494,1056,754,740,699,536$.
${ }^{1}$ H NMR ( $200 \mathbf{M H z}$, CDCl $_{3}$ ): $\delta 1.89(\mathrm{~s}, 1 \mathrm{H}), 4.18-4.24(\mathrm{~m}, 3 \mathrm{H}), 7.34(\mathrm{~m}, 10 \mathrm{H})$
EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $198\left[\mathrm{M}^{+}\right](8.0), 184$ (4.6), 167 (100), 152 (21.3), 128 (3.3), 105 (21.3), 91 (6.7), 77 (21.3), 63 (7.3).

## 9-Fluorenylmethanol, 152

Pale yellow solid
Yield: 76\%
M.p.: $98-100^{\circ} \mathrm{C}$

IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max } 3355,1585,1449,1087,759,737$
${ }^{\mathbf{1}} \mathbf{H}$ NMR ( $\mathbf{2 0 0} \mathbf{~ M H z}, \mathbf{C D C l}_{3}$ ): $\delta 1.89(\mathrm{~s}, 1 \mathrm{H}), 4.2-4.27(\mathrm{~m}, 3 \mathrm{H}), 7.35(\mathrm{~m}, 8 \mathrm{H})$
EIMS ( $\boldsymbol{m} / \boldsymbol{z}$, relative intensity, \%): $196\left[\mathrm{M}^{+}\right]$(10.5), 165 (100), 77 (21.0), 63 (10.1).

## Alcohol 153

Colorless syrup
Yield: 78\%
IR (neat, $\mathbf{c m}^{\mathbf{- 1}}$ ): $v_{\max } 3353,1671,1489,1034,759,738$

${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 1.7-2.0(\mathrm{~m}, \mathbf{4 H}), 2.5(\mathrm{~s}, 1 \mathrm{H}), 2.8(\mathrm{~m}, 2 \mathrm{H}), 3.2(\mathrm{~m}, 1 \mathrm{H}), 3.85(\mathrm{~d}, J$ $=6.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.3(\mathrm{~m}, 4 \mathrm{H})$

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $162\left[\mathrm{M}^{+}\right]$(13.6), 131 (100), 115 (21.4), 103 (5.2), 91 (35.7), 77 (10.4), 63 (7.1).

## Alcohol 154

Colorless syrup
Yield: 80\%

IR (neat, $\mathbf{c m}^{\mathbf{- 1}}$ ): $v_{\max } 3381,1609,1579,1330,1041,814$
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 1.31(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}), 1.6-2.0(\mathrm{~m}, 2 \mathrm{H}), 2.34(\mathrm{~s}, 1 \mathrm{H}), 2.7-3.0(\mathrm{~m}$, 3 H ), 3.77 (m, 2H), 3.79 (s, 3H), 6.7-6.9 (m, 2H), 7.2 (m, 1H)
EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $192\left[\mathrm{M}^{+}\right]$(58.8), 177 (22.8), 161 (100), 148 (98.7), 135 (16.9), 115 (24.0), 105 (19.6), 91 (24.8), 77 (18.9), 65 (8.5).

## PCC oxidation of homobenzylic and homoallylic alcohols:

## General Procedure:

To a mixture of PCC (1.5 or $3-4$ equivalents) and powdered molecular sieves ( $3 \mathrm{~A}^{\circ}, 1 / 2$ the wt of PCC) in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was added the homobenzylic or homoallylic alcohol (1 equivalent) at $0^{\circ} \mathrm{C}$. The reaction mixture was stirred for the specified time (4-12 h) at room temperature. $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was evaporated and, to the residue was added $\mathrm{Et}_{2} \mathrm{O}$. The slurry was stirred and filtered
through a pad of celite. The residue was washed 3 to 4 times and filtered. The filtrate was concentrated to give virtually pure carbonyl compounds.

## 4-Benzyloxybenzaldehyde, 119

White solid
Yield: 70\%
M.p.: $78-79^{\circ} \mathrm{C}$

IR ( $\mathbf{C H C l}_{3}, \mathbf{c m}^{-1}$ ): $v_{\max } 2728,1690,1601,1578,832,758$
${ }^{\mathbf{1}} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 5.16(\mathrm{~s}, 2 \mathrm{H}), 7.1(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}), 7.3(\mathrm{~m}, 5 \mathrm{H}), 7.85(\mathrm{~d}, J=8$ $\mathrm{Hz}, 2 \mathrm{H}), 9.9$ (s, 1H)

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $212\left[\mathrm{M}^{+}\right]$(4.3), 91 (100), 65 (9.5).
p-Anisaldehyde, 123
Pale yellow oil
Yield: 69\%

123
IR ( $\left.\mathbf{C H C l}_{3}, \mathbf{c m}^{-1}\right): v_{\max } 2740,1685,1600,1578,1026,834$
${ }^{1} \mathbf{H}$ NMR ( $200 \mathbf{M H z}$, CDCl $_{3}$ ): $\delta 3.85(\mathrm{~s}, 3 \mathrm{H}), 6.99(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}), 7.83(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}), 9.85$ ( $\mathrm{s}, 1 \mathrm{H}$ )

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$, relative intensity, \%): $136\left[\mathrm{M}^{+}\right](100), 119$ (30.2), 104 (23.5), 92 (28.2), 77 (75.2), 65 (32.2).

## 4-Chlorobenzaldehyde, 125

Pale yellow solid
Yield: 63\%
M.P.: $44-46^{\circ} \mathrm{C}$

125

IR ( $\left.\mathbf{C H C l}_{3}, \mathbf{c m}^{-1}\right): v_{\max } 2840,1695,1589,1094,839,816,541$
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 7.53(\mathrm{~d}, J=10 \mathrm{~Hz}, 2 \mathrm{H}), 7.84(\mathrm{~d}, J=10 \mathrm{~Hz}, 2 \mathrm{H}), 9.98(\mathrm{~s}, 1 \mathrm{H})$
EIMS ( $\boldsymbol{m} / z$ relative intensity, \%): $140\left[\mathrm{M}^{+}\right]$(76.8), 139 (100), 111 (53.6), 85 (7.9), 75 (37.1), 57 (6.0).

## 4-Bromobenzaldehyde, 127

Colorless solid
Yield: 64\%
M.P.: $65-67^{\circ} \mathrm{C}$

IR ( $\left.\mathbf{C H C l}_{3}, \mathbf{c m}^{-1}\right): v_{\max } 2836,1686,1581,1085,841,812,545$
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 7.54(\mathrm{~d}, J=10 \mathrm{~Hz}, 2 \mathrm{H}), 7.85(\mathrm{~d}, J=10 \mathrm{~Hz}, 2 \mathrm{H}), 9.99(\mathrm{~s}, 1 \mathrm{H})$
EIMS ( $\boldsymbol{m} / z$ relative intensity, \%): $185\left[\mathrm{M}^{+}\right]$(72.8), 184 (100), 156 (23.8), 130 (17.9), 75 (37.5), 57 (16.0).

## 2-Benzyloxybenzaldehyde, 129

Colorless solid
Yield: 66\%
M.p.: $45-46^{\circ} \mathrm{C}$

129

IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max }$ 2862, 1684, 1598, 1303, 1013, 855, 736, 697
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 5.01(\mathrm{~s}, 2 \mathrm{H}), 6.90(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}), 7.31(\mathrm{~m}, 6 \mathrm{H}), 7.71(\mathrm{~d}, J=8$ $\mathrm{Hz}, 1 \mathrm{H}), 10.4$ (s, 1H)

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $212\left[\mathrm{M}^{+}\right]$(6.5), 183 (6.5), 152 (3.2), 121 (13.0), 91 (100), 77 (6.5), 65 (28.7).
o-Anisaldehyde, 131
Colorless oil
Yield: 64\%

131

IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max }$ 2845, 1688, 1600, 1439, 1104, 835, 759
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ) : $\delta 3.95(\mathrm{~s}, 3 \mathrm{H}), 7.1(\mathrm{~m}, 2 \mathrm{H}), 7.62(\mathrm{~m}, 1 \mathrm{H}), 7.85(\mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H})$, 10.45 (s, 1H)

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $136\left[\mathrm{M}^{+}\right]$(100), 119 (29.6), 104 (22.3), 92 (31.0), 71 (69.7), 65 (34.8).
o-Chlorobenzaldehyde, 133
Colorless oil
Yield: 70\%

IR (neat, $\mathbf{c m}^{\mathbf{- 1}}$ ): $v_{\max } 2753,1696,1650,1591,1053,825,758,633$

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $140\left[\mathrm{M}^{+}\right]$(69.3), 139 (100), 111 (53.6), 104 (10.4), 85 (13.0), 75 (79.0), 61 (17.0), 55 (7.8).

## 3,4-Dimethoxybenzaldehyde, 135

Colorless solid
Yield: $72 \%$
M.p.: $41-42^{\circ} \mathrm{C}$

IR (neat, $\mathbf{c m}^{\mathbf{- 1}}$ ): $v_{\text {max }}$ 2839, 1681, 1590, 1022, 812, 733, 642
${ }^{1}{ }^{\mathbf{H}} \mathbf{N M R}\left(200 \mathrm{MHz}, \mathbf{C D C l}_{3}\right): \delta 3.90(\mathrm{~s}, 3 \mathrm{H}), 3.93(\mathrm{~s}, 3 \mathrm{H}), 6.96(\mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H}), 7.42(\mathrm{~m}, 2 \mathrm{H})$, $9.81(\mathrm{~s}, 1 \mathrm{H})$

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $166\left[\mathrm{M}^{+}\right](100), 165$ (70), 151 (1.2), 119 (10.7), 105 (9.3), 95 (56), 77 (32.0), 65 (14.6).

## 3,4,5-Trimethoxy benzaldehyde, 137

Pale yellow solid
Yield: 73\%
M.p.: $72-74^{\circ} \mathrm{C}$

IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max } 2737,1692,1588,1232,1001,834,755,628$
${ }^{1} \mathbf{H}$ NMR ( $\mathbf{2 0 0} \mathbf{~ M H z}, \mathbf{C D C l}_{3}$ ): $\delta 3.90(\mathrm{~s}, 9 \mathrm{H}), 7.1(\mathrm{~s}, 2 \mathrm{H}), 9.83(\mathrm{~s}, 1 \mathrm{H})$
EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $196\left[\mathrm{M}^{+}\right](100), 181$ (55.8), 175 (5.8), 153 (9.0), 135 (10.4),
7.5 (48.7), 110 (42.8), 95 (34.4), 77 (19.5), 67 (19.5), 57 (19.6).

## 2,4-Dimethoxybenzaldehyde, 139

Pale yellow solid
Yield: 73\%
M.p.: $68-70^{\circ} \mathrm{C}$

IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max }$ 2847, 1673, 1602, 1440, 1105, 828, 763, 668

139
${ }^{1} \mathbf{H}$ NMR $\left(\mathbf{2 0 0} \mathbf{~ M H z}, \mathbf{C D C l}_{3}\right): \delta 3.82(\mathrm{~s}, 3 \mathrm{H}), 3.9(\mathrm{~s}, 3 \mathrm{H}), 6.48-6.6(\mathrm{~m}, 2 \mathrm{H}), 7.76(\mathrm{~d}, J=8 \mathrm{~Hz}$, $1 \mathrm{H}), 10.3$ (s, 1H)

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $166\left[\mathrm{M}^{+}\right]$(100), 165 (65.6), 149 (53.9), 135 (28.6), 120 (24.7), 106 (22.7), 92 (9.7), 77 (11.7), 63 (7.1).
m-Anisaldehyde, 141
Colorless solid
Yield: 65\%

M.p.: $33^{\circ} \mathrm{C}$

IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max }$ 2730, 1701, 1593, 1263, 1038, 898, 772, 681, 644
${ }^{1} \mathbf{H}$ NMR ( $200 \mathbf{~ M H z}, \mathbf{C D C l}_{3}$ ): $\delta 3.8(\mathrm{~s}, 3 \mathrm{H}), 7.23(\mathrm{~m}, 1 \mathrm{H}), 7.48(\mathrm{~m}, 3 \mathrm{H}), 9.98(\mathrm{~s}, 1 \mathrm{H})$
EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $136\left[\mathrm{M}^{+}\right](100), 135$ (92.81), 107 (43.8), 92 (24.8), 77 (64.0), 65 (39.2).
p-Tolualdehyde, 143
Colorless oil
Yield: 66\%

IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max } 2733,1698,1605,1222,805,750$
${ }^{\mathbf{1}} \mathbf{H}$ NMR ( $200 \mathbf{~ M H z}, \mathbf{C D C l}_{3}$ ): $\delta 2.42(\mathrm{~s}, 3 \mathrm{H}), 7.3(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}), 7.9(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}), 9.95$ ( $\mathrm{s}, 1 \mathrm{H}$ )

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $120\left[\mathrm{M}^{+}\right]$(80), 119 (100), 105 (8.3), 91 (92), 77 (12.7), 65 (43.1).

Acetophenone, 81
Colorless oil
Yield: 71\%
IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max } 1684,1596,1278,1076,760,690,588$

81
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 2.62(\mathrm{~s}, 3 \mathrm{H}), 7.47(\mathrm{~m}, 3 \mathrm{H}), 7.95(\mathrm{~d}, J=10 \mathrm{~Hz}, 2 \mathrm{H})$
EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \% ): 120 [ $\left.\mathrm{M}^{+}\right]$(52), 105 (100), 77 (98.7), 74 (8.7), 63 (6.0).

## 4-Hydroxyacetophenone, 146

Pale yellow solid
Yield: 63\%
M.p.: $105-106^{\circ} \mathrm{C}$

IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max } 3380,1661,1604,1362,840,768,699$

${ }^{1}{ }^{\mathbf{H}} \mathbf{N M R}\left(\mathbf{2 0 0} \mathbf{~ M H z}, \mathbf{C D C l}_{3}\right): \delta 2.6(\mathrm{~s}, 3 \mathrm{H}), 6.99(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}), 7.94(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}), 8.44$ (s, 1H).

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $136\left[\mathrm{M}^{+}\right]$(36.7), 121 (100), 107 (2.7), 93 (28.7), 77 (12.0), 65 (26.7).

Propiophenone, 148
Colorless oil
Yield: 68\%
IR (neat, $\mathbf{c m}^{-1}$ ): $V_{\max } 1685,1594,1222,750$,

${ }^{1} \mathbf{H}$ NMR ( $200 \mathbf{~ M H z}, \mathbf{C D C l}_{3}$ ): $\delta 1.22(\mathrm{t}, J=8 \mathrm{~Hz}, 3 \mathrm{H}), 2.98(\mathrm{q}, J=8 \mathrm{~Hz}, 2 \mathrm{H}), 7.45(\mathrm{~m}, 3 \mathrm{H})$, $7.95(\mathrm{~d}, J=7 \mathrm{~Hz}, 2 \mathrm{H})$

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $134\left[\mathrm{M}^{+}\right]$(21.7), 119 (5.8), 105 (100), 91 (19.5), 77 (47.0), 71 (5.8), 65 (4.3), 57 (7.2).

## 4-Chloroacetophenone, 150

Pale yellow oil
Yield: 63\%

IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\text {max }} 1660,1608,1352,840,765,698$
${ }^{1} \mathbf{H}$ NMR ( $200 \mathbf{M H z}, \mathbf{C D C l}_{3}$ ): $\delta 2.57(\mathrm{~s}, 3 \mathrm{H}), 7.43(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}), 7.90(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H})$
EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $154\left[\mathrm{M}^{+}\right]$(29.0), 139 (100), 111 (49.3), 104 (2.0), 85 (3.8),
75 (31.6), 63 (5.3).

## Benzophenone, 19

White solid
Yield: 75\%

M.p.: $47-48^{\circ} \mathrm{C}$

19
IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max } 1659,1619,1599,1217,1074,920,710,667,639$
${ }^{\mathbf{1}} \mathbf{H}$ NMR ( $\mathbf{2 0 0} \mathbf{~ M H z}$, CDCl $_{3}$ ): $\delta 7.31(\mathrm{~m}, 6 \mathrm{H}) 7.59(\mathrm{~d}, J=7 \mathrm{~Hz}, 4 \mathrm{H})$
EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $182\left[\mathrm{M}^{+}\right](68.8), 171$ (5.7), 152 (5.7), 105 (100), 91 (3.5), 77 (75.9), 63 (3.5).

## Fluorenone, 90

Pale yellow solid
Yield: 63\%

M.p.: $82-84^{\circ} \mathrm{C}$

IR (neat, $\mathbf{c m}^{\mathbf{- 1}}$ ): $v_{\text {max }} 1712,1610,1598,1300,1263,1222,813,735,670$
${ }^{1}$ H NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 7.34(\mathrm{~m}, 2 \mathrm{H}), 7.5(\mathrm{~m}, 4 \mathrm{H}), 7.68(\mathrm{~d}, J=7 \mathrm{~Hz}, 2 \mathrm{H})$
EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $180\left[\mathrm{M}^{+}\right]$(100), 152 (36.8), 126 (8.5), 98 (78.4), 76 (37.5), 63 (23.0).

## 1-Tetralone, 96

Colorless oil
Yield: 66\%
IR (neat, $\mathbf{c m}^{-1}$ ): $V_{\max } 1683,1600,1191,1025,905,765,553$

96
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 2.04-2.17(\mathrm{~m}, 2 \mathrm{H}), 2.63(\mathrm{t}, J=7 \mathrm{~Hz}, 2 \mathrm{H}), 2.94(\mathrm{t}, J=7 \mathrm{~Hz}, 2 \mathrm{H})$, $7.24(\mathrm{~m}, 2 \mathrm{H}), 7.45(\mathrm{~m}, 1 \mathrm{H}), 8.0(\mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H})$

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $146\left[\mathrm{M}^{+}\right]$(61.3), 131 (14.0), 118 (100), 104 (8.0), 90 (96.7), 77 (13.3), 63 (36.0).

## 6-Methoxy-1-tetralone, 155

Pale yellow solid
Yield: 67\%
М.p.: $76-77^{\circ} \mathrm{C}$

IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max } 1673,1599,1570,1445,1157,1035,829,755,666$
${ }^{\mathbf{1}} \mathbf{H}$ NMR ( $\mathbf{2 0 0} \mathbf{~ M H z}, \mathbf{C D C l}_{3}$ ): $\delta 2.2(\mathrm{~m}, 2 \mathrm{H}), 2.59(\mathrm{t}, J=6.5 \mathrm{~Hz}, 2 \mathrm{H}), 2.91(\mathrm{t}, J=6.5 \mathrm{~Hz}, 2 \mathrm{H})$, $3.84(\mathrm{~s}, 3 \mathrm{H}), 6.68-6.77(\mathrm{~m}, 2 \mathrm{H}), 7.96-8.01(\mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H})$

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $176\left[\mathrm{M}^{+}\right](48.3), 161$ (7.2), 148 (100), 120 (26.5), 105 (12.6), 91 (15.9), 77 (19.2), 63 (9.9).

## 3-Methyl-2-butenal, 162

Colorless liquid
Yield: 68\%

IR (neat, $\mathbf{c m}^{\mathbf{- 1}}$ ): $v_{\text {max }}$ 2738, 1688, 1609, 1438, 786
${ }^{\mathbf{1}} \mathbf{H} \mathbf{N M R}\left(\mathbf{2 0 0} \mathbf{~ M H z}, \mathbf{C D C l}_{3}\right): \delta 1.93(\mathrm{~s}, 3 \mathrm{H}), 2.12(\mathrm{~s}, 3 \mathrm{H}), 5.85(\mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H}), 9.92(\mathrm{~d}, J=8$ $\mathrm{Hz}, 1 \mathrm{H})$

EIMS (m/z relative intensity, \%): $84\left[\mathrm{M}^{+}\right](59), 55$ (100), 42 (23)

Compound mixture 164 and 165 (1:1)
Colorless oil
Yield: 60\%

IR (neat, $\mathbf{c m}^{\mathbf{- 1}}$ ): $v_{\max } 2742,1705,1660,1612,1450,1220,786$
${ }^{1}{ }^{\mathbf{H}}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 3.67(\mathrm{~d}, J=6 \mathrm{~Hz}, 2 \mathrm{H}, \mathbf{1 6 4}), 6.18(\mathrm{dd}, J=8 \mathrm{~Hz}, 1 \mathrm{H}, \mathbf{1 6 4}), 6.79$ (dd, $J=8 \mathrm{~Hz}, 1 \mathrm{H}), 6.93(\mathrm{dt}, J=16,2 \mathrm{~Hz}, 1 \mathrm{H}, 164), 7.2-7.7(\mathrm{~m}, 11 \mathrm{H}), 9.56(\mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H})$, 9.73 (d, $J=8 \mathrm{~Hz}, 1 \mathrm{H})$

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $162\left[\mathbf{1 6 5}, \mathrm{M}^{+}+2\right](3.3), 160\left[\mathbf{1 6 5}, \mathrm{M}^{+}\right](1.9), 146\left[\mathbf{1 6 4}, \mathrm{M}^{+}\right]$ (75), 131 ( $\left.\mathbf{1 6 5}, \mathrm{M}^{+}-\mathrm{CHO}\right](83.5), 117$ [ $\left.\mathbf{1 6 4}, \mathrm{M}^{+}-\mathrm{CHO}\right]$ (100), 103 (42.1), 91 (55.9), 77 (33.5), 65 (21.1), 55 (11.8).

Compound mixture 167 and 168 (1:1)
Colorless oil
Yield: 58\%

IR (neat, $\mathbf{c m}^{\mathbf{- 1}}$ ): $v_{\max }$ 2738, 1712, 1654, 1609, 1463, 1230, 789
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 2.71(\mathrm{~m}, 2 \mathrm{H}), 2.83(\mathrm{~m}, 2 \mathrm{H}), 3.69(\mathrm{~d}, J=6 \mathrm{~Hz}, 2 \mathrm{H}, \mathbf{1 6 8}), 6.1(\mathrm{~m}$, $1 \mathrm{H}), 6.95(\mathrm{~m}, 1 \mathrm{H}), 7.13(\mathrm{~m}, 1 \mathrm{H}), 7.2-7.5(\mathrm{~m}, 11 \mathrm{H}), 9.53(\mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H}), 9.58(\mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H})$ EIMS ( $\boldsymbol{m} / \mathbf{z}$ relative intensity, \%): $174\left[\mathbf{1 6 8}, \mathrm{M}^{+}\right](0.7), 160\left[167, \mathrm{M}^{+}\right](4.7), 145[168$, $\left.\mathrm{M}^{+}-\mathrm{CHO}\right](4.8), 131$ [167, $\left.\mathrm{M}^{+}-\mathrm{CHO}\right](6.6), 115$ (16.6), 105 (8.0), 91 (100), 84 (36.6), 77 (12.6), 65 (13.3).

## 4-Keto-tridec-2E-enal, 170

Colorless oil
Yield: 58\%

IR (neat, $\mathbf{c m}^{\mathbf{- 1}}$ ): $v_{\max }$ 2750, 1698, 1692, 1611, 1468, 1218, 769, 478
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 0.88(\mathrm{t}, J=6 \mathrm{~Hz}, 3 \mathrm{H}), 1.2-1.3(\mathrm{~m}, 12 \mathrm{H}) 1.65(\mathrm{~m}, 2 \mathrm{H}), 2.69(\mathrm{t}, J$ $=8 \mathrm{~Hz}, 2 \mathrm{H}), 6.82(\mathrm{~m}, 2 \mathrm{H}), 9.78(\mathrm{~d}, J=6 \mathrm{~Hz}, 1 \mathrm{H})$
${ }^{13} \mathbf{C}$ NMR ( $50 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 14.01,22.5,23.6,29.2,29.54,31.54,31.8,41.3,136.9,143.8$, 192.9, 200.09

EIMS ( $\mathrm{m} / \mathrm{z}$ relative intensity, \%): $210\left[\mathrm{M}^{+}\right]$(12.3), $181\left(\mathrm{M}^{+}\right.$-CHO] (66.2), 168 (9.3), 139 (23.4), 125 (25.3), 98 (58.7), 83 (85.2), 55 (100)

Analysis: $\mathrm{C}_{13} \mathrm{H}_{22} \mathrm{O}_{2}(210.31)$ requires $\mathrm{C}, 74.24 ; \mathrm{H}, 10.54$. Found: C, $74.29 ; \mathrm{H}, 10.46$.

## 4-Keto-pentadec-2E-enal, 172

White solid
Yield: 59\%
М.р.: $78-80^{\circ} \mathrm{C}$

IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max }$ 2736, 1696, 1694, 1612, 1216, 759, 477
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 0.88(\mathrm{t}, J=6 \mathrm{~Hz}, 3 \mathrm{H}), 1.2-1.3(\mathrm{~m}, 16 \mathrm{H}) 1.69(\mathrm{~m}, 2 \mathrm{H}), 2.7(\mathrm{t}, J=$ $8 \mathrm{~Hz}, 2 \mathrm{H}), 6.83(\mathrm{~m}, 2 \mathrm{H}), 9.8(\mathrm{~d}, J=6 \mathrm{~Hz}, 1 \mathrm{H})$
${ }^{13} \mathbf{C}$ NMR (50 MHz, CDCl ${ }_{3}$ ): $\delta 14.03,22.64,23.66,29.07,29.29,29.55,31.86,41.20,137.28$, 144.89, 193.34, 200.14

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $238\left[\mathrm{M}^{+}\right]$(9.1), $209\left[\mathrm{M}^{+}-\mathrm{CHO}\right](68.2), 195$ (3.2), 183 (4.5), 153 (5.8), 139 (28.6), 125 (43.5), 111 (15.6), 98 (56.5), 83 (76.6), 70 (40.2), 55 (100)

Analysis: $\mathrm{C}_{15} \mathrm{H}_{26} \mathrm{O}_{2}(238.37)$ requires $\mathrm{C}, 75.58 ; \mathrm{H}, 10.99$. Found: C, $75.39 ; \mathrm{H}, 10.76$.

## 4-Keto-nonadec-2E-enal, 174

Pale yellow solid
Yield: 60\%
M.p.: $85-88^{\circ} \mathrm{C}$

IR (neat, $\mathbf{c m}^{-1}$ ): $v_{\max } 2736,1696,1695,1610,1468,1216,758,669,502$
${ }^{\mathbf{1}} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 0.88(\mathrm{t}, J=6 \mathrm{~Hz}, 3 \mathrm{H}), 1.2-1.3(\mathrm{~m}, 24 \mathrm{H}) 1.71(\mathrm{~m}, 2 \mathrm{H}), 2.69(\mathrm{t}, J$ $=8 \mathrm{~Hz}, 2 \mathrm{H}), 6.84(\mathrm{~m}, 2 \mathrm{H}), 9.81(\mathrm{~d}, J=6 \mathrm{~Hz}, 1 \mathrm{H})$
${ }^{13} \mathbf{C}$ NMR ( $50 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 14.0,22.6,23.63,29.03,29.29,29.58,31.86,41.16,137.21$, 144.82, 193.26, 200.03

EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $294\left[\mathrm{M}^{+}\right]$(2.6), $265\left[\mathrm{M}^{+}-\mathrm{CHO}\right](5.9), 139$ (9.9), 125 (13.2), 98 (42.7), 83 (82.2), 70 (46.0), 55 (100).
Analysis: $\mathrm{C}_{19} \mathrm{H}_{34} \mathrm{O}_{2}$ (294.47) requires C, 77.5; H, 11.63. Found: C, 77.39; H, 11.44.

## Pentadec-2E-enal, 175

Colorless syrup
Yield: 28\%

175

IR (neat, $\mathbf{c m}^{\mathbf{- 1}}$ ): $v_{\max } 1696,1611,1459,1220,768,649,501$
${ }^{1} \mathbf{H}$ NMR ( $200 \mathrm{MHz}, \mathbf{C D C l}_{3}$ ): $\delta 0.88(\mathrm{t}, J=6 \mathrm{~Hz}, 3 \mathrm{H}), 1.19-1.25(\mathrm{~m}, 18 \mathrm{H}) 1.55(\mathrm{~m}, 2 \mathrm{H}), 2.24$ $(\mathrm{m}, 2 \mathrm{H}), 6.01(\mathrm{dt}, J=16 \mathrm{~Hz}, 1 \mathrm{H}), 6.81(\mathrm{dt}, J=16, \mathrm{~Hz}, 1 \mathrm{H}), 9.44(\mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H})$ EIMS ( $\boldsymbol{m} / \boldsymbol{z}$ relative intensity, \%): $224\left[\mathrm{M}^{+}\right]$(10.5), 195 [68.0] 182 (5.4), 169 (12.5), 70 (40.2), 55 (100).

Analysis: $\mathrm{C}_{15} \mathrm{H}_{28} \mathrm{O}(224.38)$ requires C, $80.29 ; \mathrm{H}, 12.57$. Found: $\mathrm{C}, 80.35 ; \mathrm{H}, 12.32$.

### 5.6. Spectra

+1] ${ }^{1}$ H NMR Spectrum of $\mathbf{1 3 6}$
+2] ${ }^{1}$ H NMR Spectrum of $\mathbf{1 5 4}$
$+3]{ }^{1} \mathrm{H}$ NMR Spectrum of $\mathbf{1 6 4 + 1 6 5}$
+4] EIMS of $\mathbf{1 6 4 + 1 6 5}$
$+5]{ }^{1} \mathrm{H}$ NMR Spectrum of $\mathbf{1 7 2}$
$+6]{ }^{13} \mathrm{C}$ NMR Spectrum of $\mathbf{1 7 2}$
+7] EIMS of $\mathbf{1 7 2}$

$+\quad{ }^{1} \mathrm{H}$ NMR Spectrum of $\mathbf{1 5 4}$

$+\quad{ }^{1}$ H NMR Spectrum of $\mathbf{1 6 4 + 1 6 5}$

$$
+\quad \text { EIMS of } \mathbf{1 6 4}+\mathbf{1 6 5}
$$

$+\quad{ }^{13} \mathrm{C}$ NMR Spectrum of $\mathbf{1 7 2}$

## $+\quad$ EIMS of $\mathbf{1 7 2}$
